You will have to wait longer to purchase Lenovo PHAB 2 Pro. <http://dgit.in/Phb2PDlyd>

Smartphone test

BATTERY

OnePlus 3

It's 3000 mAh battery gives the OnePlus 3 about a day's worth of battery life. On the Geekbench 3 battery test, the phone earns a score of 3850, which is pretty much average. It's not the ideal battery life you want from a phone, but enough to make the OnePlus 3 a good all rounder. Power users will need to charge the phone once every night.

LeEco Le Max 2

The Le Max 2 is the only one with a QHD display, and it's bigger than the others. This takes a toll on it's 3100 mAh battery. It's Geekbench 3 rating is surprisingly more than the OnePlus 3, but we didn't see the 4788 rating translate in real world usage. On regular usage, we got a best of 12-16 hours out of this phone, which is pretty much what the OnePlus 3 provides.

Xiaomi Mi 5

It's admirable that Xiaomi has been able to put a 3000 mAh battery on such a compact device, but the Mi 5 is still weakest in terms of battery life. You'll still need to charge the Mi 5 at least twice a day, with about 10-12 hours of battery life on a full charge. This is again surprising, since the Mi 5 has the smallest display of the lot, and only 1080p resolution.

ASUS Zenfone 3

The Zenfone 3 outlasts all others in the battery department. It scores a Geekbench 3 rating of 7043, which is considerably higher than all the others. On regular usage, we were able to get a day and a half's worth of usage out of the device. It has a 5.5 inch 1080p display, but the brightness is lower, which perhaps helps as well.

DISPLAY

OnePlus 3

In terms of brightness, the OnePlus 3 is the brightest amongst these four devices. Our Lux meter test showed 800 Lux at maximum brightness, which is dangerously close to iPhone territory. That's saying something for a phone that costs less than half of what Apple's flagship does.

OnePlus' Optic AMOLED panel is not only bright, though. It also does well with the colours, unlike many other AMOLED panels. Thankfully, OnePlus has tuned the display well enough to avoid major colour cast issues, and the OnePlus 3 depicts colours that are vibrant, but not massively plagued by a single tint.

LeEco Le Max 2

The Le Max 2 has the highest resolution, but QHD doesn't automatically mean the display is good. The Le Max 2's display is dim, and considerably dimmer than the OnePlus 3 or the Xiaomi Mi 5. It does well in terms of sharpness and colours, but sunlight visibility is a major issue, because of its dimness.

So you may face issues using this one out in broad daylight. Whereas on the other hand, using it indoors might still leave a lot to be desired compared to the other phones in this category like the OnePlus 3 and the Mi 5.

So if you are all for resolution, then the Le Max 2 is great, but not the brightest.

Xiaomi Mi 5

The Xiaomi Mi 5 produced a maximum brightness of 686 Lux, which, though lower than the OnePlus 3, is brighter than the ASUS Zenfone 3 and the LeEco Le Max 2. If you like vibrant and punchy colours, the Mi 5 will suit your needs, even in sunlight.

However, it does have a bluish tint on its default mode. You can correct this by turning on the Reading Mode, and reducing the intensity. This'll create a warmer profile.

Overall, the display is quite good. The change from the usual 12-14 backlight LEDs to 16 brings the additional brightness here that is a welcome feature.

ASUS Zenfone 3

The Zenfone 3 has a pixel density of 401 ppi, but lacks the deep blacks that make a pleasant display. It's also not very bright, with a maximum reading of 618 Lux on our Lux meter test. The Zenfone 3's display is sufficient at best, with nothing extraordinary, or really commendable about it.

So even with a resolution of 1920 x 1080 on the Super IPS+ panel, this is not really the best display. In fact, it's far from that. You may not get the best sunlight reading experience out of it either. In fact, we don't even know what else to write about it, so you know that it's really nothing unique.
