CAN YOU SURVIVE A MONTH ON JUST A CHROME BOOK?

Google's Chrome OS has been around for more than five years now. Is it ready to be your primary operating system?

Arnab Mukherjee

arnab@digit.in

The way we use our operating systems has changed drastically over the years. From Office tools to entertainment, everything within an operating system, be it Windows, iOS or Linux, has evolved to become more mature than ever in the past. And one of the constant features of the connected computing world – the web browser – has perhaps shown some of the largest leaps in terms of capabilities. There couldn't be a better example of this than Google's Chrome OS, an entire operating system based on Google's Chrome web browser.

The Chrome OS came into being after Google realised that their people were using their browser for most of their computing needs. Be it Google's cloud based office tools (Docs, Sheets, Slides) or web apps from third par-

ties (Skype, Pixlr and more), on the surface Google's Chrome OS can offer you everything that you might need from a typical computing platform. But can it really? I spent a month with the Chromebook as my only device to find the answer. Here's my log:

An exercise in trust

Setting up the Chromebook was as easy as setting up a new Android phone (Hurrah for Google

accounts and their synchronisation!). As an update from previous versions of the Chrome OS, it now has a desktop (with customisable wallpapers, no less!). Basic tasks like connecting to the Wi-Fi, Bluetooth, etc., are pretty intuitive with browser like Windows. And

The Chrome OS makes the Chromebook a truly open and shut device. None of my logins took more than 10 seconds to bring up the login screen from a complete shutdown. As a default setting it brings up all the windows that were open when the Chromebook was shut down. Personally, I prefer it that way. But if you need to disable it, go to Settings -> Advanced settings -> On Startup and select the 'Open a New Tab page' option. You can even set it to open specific pages on startup.

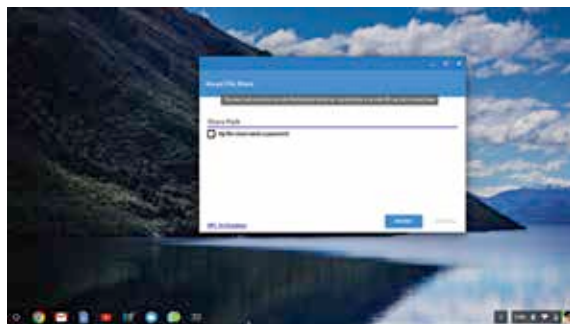

Devices can be added as plug and play. It detected my standard mouse without a hitch. It also played HD video off a pendrive without any lag on the VLC app. Also, the app launcher is a welcome Android inspired feature and the Downloads folder is the root drive, which makes sense on a browser based OS.

I haven't really shut it down over the weekend, but then I barely used it for 4 hours. The Chromebook uses almost no power if you simply close the lid in the logged in state, as it turns off the Wifi adapter, which it turns on again once you log in.

First day for the Chromebook at office. First problem faced – connecting to network drives.

The Network File Share for Chrome OS app
