

'COURAGEOUS' APPLE?

Apple argues that the future of audio is wireless, agreed, but that does not mean that we kill the ports immediately? Thanks to Apple, the latest iPhone users will have to buy the new \$159 accessory, but hey, why did Apple kill the ubiquitous jack is the question you should be asking. <http://dgit.in/iJckRIP>

WHERE IS ESPORTS HEADING?

The world of multiplayer online battle arena gaming continues to soar in popularity and profitability with every passing year. However, the statistics show a whole different story altogether, the story of the struggle to keep pace. <http://dgit.in/EsportsStrgl>

3 DAYS OF PWNAGE AT DEF CON

Wondered how would a hackers conference or a meet be like? Hold back as we take you down to Las Vegas where the Canadian Hacking group with the name Platinum Net has been organising their 'convention' for 24 years now. <http://dgit.in/DefConvsn>

UBER'S SELF-DRIVING CARS ARE HERE

Analysts may say that self-driving cars are at least a decade away but companies beg to differ. Uber's first self-driving fleet has already hit the roads that consist of modified Volvo XC90 but will be under supervision by humans in the driver's seat for the time being. <http://dgit.in/SelfDrUber>

As we told you before, swiping right will bring up a much improved widget interface where users can place things like favourite Contacts, Reminders, Siri suggestions, Maps, News and more. This allows for easy access to the most used functions on the device and users can also add or remove widgets as per their preferences.

The Bad: Notifications on iOS 10 look bigger and bolder, and are very reminiscent of Android notifications. I personally don't like the rectangles in the notifications center, although some may prefer the new black text on the white background, which makes it easier to read notifications. The previous OS had white text on a black backdrop, sans the annoying rectangles. In iOS 10, you

place - the widget interface. Did Cupertino run out of options? .

Siri

The Good: Everything with Siri seems to be good in iOS 10. The iOS voice assistant now gets third-party app integration and can type out a WhatsApp message for you or look up restaurants on Zomato, in addition to posting Facebook statuses and Tweets. It can even call you an Uber, but the feature is not available in India just yet. This only goes to show the potential of Siri, something even Google Now cannot do till now. The Google Assistant on the soon to be launched Allo Messaging app does get some of these functions. Seems like Apple has finally stopped doing a catch-up job.

Messages on iOS 10; Sending songs, sharing GIFs & images, sketching

Messages now, and this isn't a good thing for your iPhone's battery. iOS 10 is definitely feature packed, but at the same time it is also a battery guzzler and prolonged use of the Messages app tends to drain the battery quite rapidly.

Apple Music

The Ugly: What did they do to the sophisticated and cool Apple Music? The music streaming app has never looked this bad. The icons are ugly, the font size is better for those with a weak eyesight, the whole design reminds me of an old iPod. For this reason alone, I am willing to switch back to iOS 9.

The Good: With iOS 10 you can now get lyrics on Apple Music which is great addition for Karaoke fans. However, not all songs come with lyrics, as you can see in the screenshot above. The 'For You' section adds 'Connected Posts' from various artists and a 'My Favourite Mix' list which updates as per your listening preferences.

So, those were all things good, bad and ugly in the new iOS 10 update. Of course, there's much more to Apple's new software update, and we will definitely keep you informed on the same. Meanwhile, try it out. [d](#)

3D touch to view folder notifications on iOS 10

can even club a set of similar apps in a single folder, which will then give you a cumulative read on the number of notifications in that folder, but the feature requires 3D touch to view these notifications at a glance.

The Ugly: Swiping right from the lock screen, from the notifications screen and from the home screen, all take you to one

Siri on iOS 10

Messages

The Good: iOS 10 seems to have put life back into the boring old SMS app. You can now do a bunch of cool stuff straight from Messages, including - search and share popular GIFs, images and videos; Send Digital Touch Messages like heartbeats, doodles and more; Send short video clips with disappearing doodles; Send invisible ink message which have to be rubbed to be read; Share Apple Music tracks.

The Bad: You may just get overwhelmed with all that you can do on
