Mysterious virus, overheating laptop and a dead iPod; we tackle them all

Even though you might love your gadgets a lot, there are times when nothing you do works. Is it really the end? Not if we have anything to do about that!

Driver confusion

Hello! I have a small query regarding driver updates on my laptop. I have a HP AB 522TX running the latest version of Windows (anniversary update). The thing is, when I click on update driver for my graphics card in the Nvidia GeForce Experience application it says I have the latest update but when I check the same on the slimdrivers application it says that there is an update available, same goes for display, network and processor updates, I mean shouldn't the latest update of Windows pack all of that. Please advise. Also is slimdrivers good enough for updating my driver's or do you recommend something else? Thank you.

—Pranav Kumar

A Hey Pranav, a better way to ensure that you have the latest updates and drivers installed is by downloading them from the official websites or aggregators. Although third-party software makes it easier to download every update with one click, manually downloading and installing them leaves no room for error. If it sounds tasking to visit every website for your drivers, another way would be to download them from software aggregators such as Softpedia, Filehorse, Filehippo, etc.

Keyboard vs Virus

I'm having problems with my laptop since the last month. Whenever I want to select a folder, more than one folder gets selected. So, I can't double click, otherwise several windows open up at a time. It works in a way as if I am pressing the CTRL key. Once I did a full PC scan with Windows Defender then it

got solved for around five minutes. But it was then all the same. I don't use any anti-virus either. Could it be a problem? Now I have to right-click each time I want to open something. It applies only with the folders and desktop icons. And not the same within any application options where I can select any option. My laptop configuration is as follows:

- Lenovo B40 80 (JVLU65UC)
- Windows 10 Pro 64-bit
- Intel Platinum 3825U
- 4GB DDR3
- HDD 500GB

—Joydeep Rabha, Assam

A Hey Joydeep, Although a virus can be programmed to mess with your system in the way you've described, it seems more like there's an issue with your keyboard, especially the Ctrl or Shift key. You need to find out if these two keys are stuck to the base, making it difficult to select the files. If the keys are fine, then it could be a glitch in the OS, but we weren't able to come across any such issue on forums for Windows 10. Try to reset your system to factory settings and then verify whether the problem persists. Not having an antivirus can make your system highly vulnerable to attacks and we would suggest you to download and install an antivirus tool. You'll be fine with free solutions such as Avast, Avira, Comodo etc.

VLC on browser

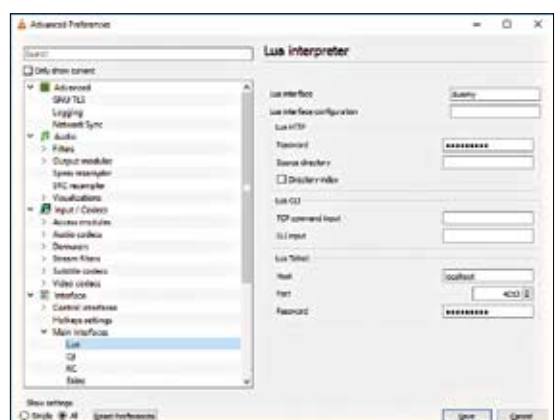

Hello, this is Raveena. I was

checking out the magazine of August 2016. I came across a tip on remote controlling VLC from a browser on page 68. And I tried but I'm not able to figure it out, exactly how it works. So, could anybody help me out?

—Raveena

A Hey Raveena, we missed out a few steps to remotely control VLC from any browser. In the Preferences tab in VLC, select the All radio button at the bottom left and then go to Main Interface. Enable Web and then go back to the left column and Main Interface > Lua. Here add your desirable password to both Lua HTTP and Lua Telnet. Save and restart VLC.

Now, open browser and enter <http://localhost:8080>, where localhost can be replaced with the IP address of the PC you want to control. You'll be asked to enter a username and password, where you need to enter only the password you had saved, and not the username. You'll get the interface and now you can control the media playing on VLC player through the web interface.

Set the password for Lua HTTP and Lua Telnet
