

DOING YOUR BIT

For starters, let us put this little thing called a disclaimer right at the top. We don't encourage you to go ahead and hack websites or send out DDoS attacks. These things are not so easy to execute for anyone without any prior experience and staying anonymous while doing so is also difficult. Additionally, if you are caught and prosecuted you're guaranteed to either be incarcerated for a long time or at least be rendered bankrupt. The fines that such offenses carry are not small. Moreover, India has extradition treaties with roughly 48 countries and once the fog of war has risen and all is dandy between warring nations, you'll be

knowledge about network topology and knowing at least one programming language (preferably C and C#) and a scripting language will go a long way towards making this a lot easier.

SETTING UP AN OP (OPERATION)

If you are well versed with programming and want to commence an operation then you need to find a staging area. Pick an IRC network where you're likely to find like minded Indians, and create an IRC channel for your OP. Ensure that you have a clear goal for your OP and build up a list of targets. For example, if you wish to target the electrical grid or the banking infrastructure of the enemy nation then find out which servers they

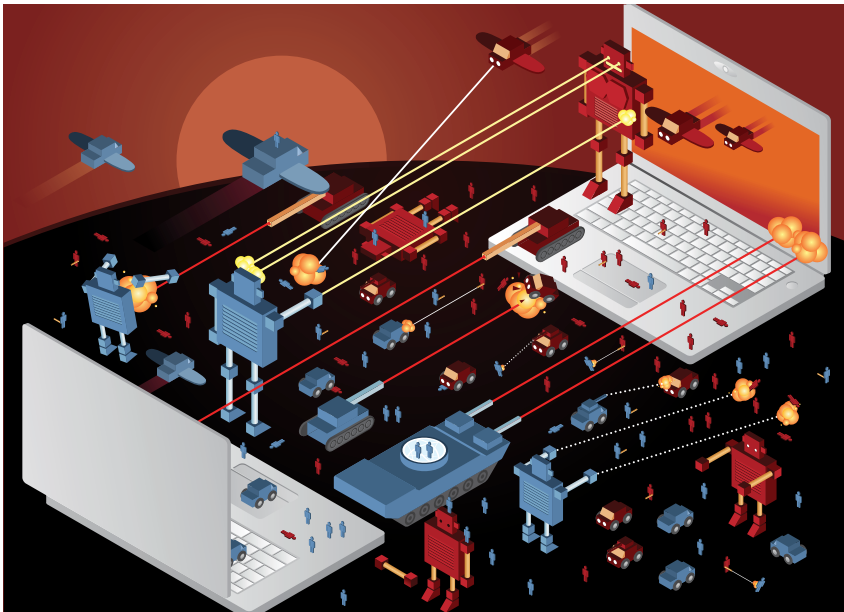

part. You can either create a DIY guide or build a bot using a builder kit like ZeuS. This is a well know builder kit so you'll have to find your own or build one from scratch as most OPs do. The bot needs to have a settings configuration, an executable for the payload, a Command-and-Control host file for the bot to pull instructions from and lastly a backdoor which uses the Socket Secure protocol allowing you to remotely control the bot.

Once the bot is created, use any means necessary to propagate it. The wider it spreads the bigger your botnet becomes. And then you have to move on to setting up your Command and Control (CnC) server. Find any cheap service which doesn't even check credentials and set up your CnC. Your CnC can be either static with a single server which becomes very easy to take down or you could create something akin to Stuxnet which would synchronise with servers in a random fashion to receive updates. Your bots will seek out this particular CnC for instructions.

You now have a botnet which should be growing rapidly waiting for instructions. The moment you believe you have enough bots live to take down the target infrastructure you may initiate a DDoS attack. There are multiple types of DDoS attacks and a well designed firewall can easily mitigate simple DDoS attacks. So a little creativity goes a long way towards making your attack a success. Individuals can also resort to using DoS tools like Nemesis, Blast and Panther to attack IP addresses but the popular tools are very easily countered and your IP gets logged quite easily. So stick to using a new tool, the newer a tool is, the more difficult it will be to counter the same.

IF NOT HACKING THEN WHAT?

Be part of the propaganda machine! No seriously, if you find pro-Indian propaganda then go create a fake ID and use a VPN, then go to every nationalistic forum/Facebook page and plaster that propaganda. Even a few posts a day is enough. Your ID will get reported and possibly banned but you'll be doing your part. Don't be outright aggressive but act a little mature and you'll be heard. 

Cyber warfare is dirty business. It's not likely to be this cute.

packed off and sent to a prison to serve a not so pleasant prison sentence. So yeah, anonymity is absolutely necessary should you go and get caught.

WHERE DO YOU START?

So your country is at war and you've decided to do your part on the cyber frontlines. IRC chatrooms are often the first place you get started with. Quite a few of them will help you figure out how to be completely anonymous on the internet. Anonymous, the infamous hacktivist collective has their IRC chatroom publicly accessible on the internet at webchat.anonops.com. Join the #learninghub channel and get started with the concepts. Having

run on and also whatever contingencies they have in place.

Put out a call to arms notice on your IRC general chatroom and get more people to join the cause. Once you have enough people on board, you need to break down your goal into smaller tasks that are to be assigned to smaller groups. Identify leaders for individual groups, maintain anonymity to the highest extent possible.

Your individual groups now need to figure out ways to disable the target be it through penetration or through a DDoS (Direct Denial of Service) attack. And you will have plenty of people signing up with no knowledge of hacking but still want to do their
