

Your complete Fallout survival kit

nected to an antenna, but short range devices with small antennas like walkie talkies should still work. Besides, you could easily salvage enough to build an AM/FM receiver if you know how (visit <http://dgit.in/bldaradio> to learn). If you're really into tinkering, a drone with a geiger counter would be a nice tool to figure out when it is safe to exit the shelter. But the cheapest one we could find was about ₹9,500 on eBay. Drones aren't dime a dozen either.

Besides communication, a first aid kit (can be found in most vehicles) or even a few sterile bandages and antiseptic would be good to have. Raid the nearest pharmacy after you're done with the supermarket, some glucose would help in case of food shortage, and a few sleeping pills may make the long wait shorter. Pick up some gloves and surgical masks too, which are the next best thing to a proper gas mask. Last but not the least, you may need a weapon, so keep something like an iron rod at hand at all times. If you find a gun, keep it to yourself. A light source like a torch would be welcome to lift spirits in the darkness of the shelter, but you may have to hack that together too, since everything made of glass would have shattered from the blast.

Now back to survival mode. You and your companion(s) should have discussed your options and divided tasks accordingly to minimize exposure. If the black rain doesn't stop soon, you'll just have to improvise a raincoat and head out since it'll soon be even more dangerous to remain there. All the best to your future self!

EPILOGUE: ALTERNATE ENDING GLOBAL NUCLEAR WINTER

World War 3 won't just happen with a single bang. It'll probably happen with about a thousand nuclear bangs, starting with the currently hot conflict zone – India. That's what Mutually Assured Destruction (MAD) is all about right? Of course, halfway through it some sense will prevail and the MADness will stop; but not before unforeseen amounts of smoke from the thousands of firestorms worldwide creates a thick enough layer in the upper atmosphere to cause an anti-greenhouse effect. Temperatures will drop, atmospheric currents will make sure radioactivity will be distributed across the planet, and life will REALLY change.

Humankind (what would be left of it) will have to adapt. Here are a few of the currently foreseeable ways we would do so:

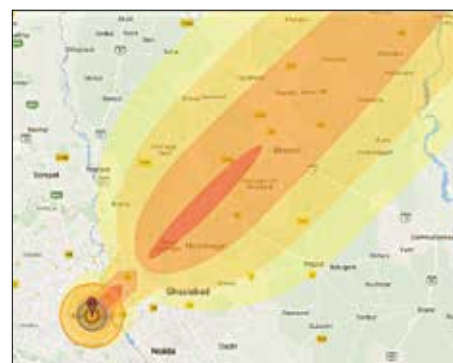

- Humanity will be forced to move underground. On the bright side, all that extra radiation outside would probably be used to light up the inside using radioluminescence. We might evolve to glow in a few generations!
- Phytoremediation techniques like rhizofiltration for using plants to

purify our water, soil and air while producing food will have to be in place on a large scale.

- Humanity will be slowly making its way to known bunker sanctuaries like the Svalbard Global Seed Vault, Norway and the Shanghai Bunker Complex, China (more: <http://dgit.in/top10bunkers>)

As of now, we ourselves are unsure whether it was appropriate to add humor to a serious topic such as this. We like dank memes, but then again, we like them more when we are not IN them.

By the time you are reading this, we've already started on next month's issue. But what if this is the last issue

A simulated 500 kiloton blast on New Delhi with fallout in a 15mph wind

you will ever read? Assuming you are still alive a few months after the dust has settled and the radioactivity has decayed, will you hold this issue and read these prophetic words again in disbelief and awe. While we certainly hope you never have to take this article seriously, if worst comes to worst, we hope it has prepared you enough. Go make it count! By which we mean, go save up and then go get a Geiger counter. **[1]**
