

NativeScript – Cross Platform Native Mobile Apps with JavaScript

>>Put you web develop skills into making a mobile app>
by **Abhishek Kant** – Sales Director and Country Head,
Progress

Have you ever been approached with the idea – “Let’s build a mobile app”. Chances are ‘Yes’. But as a developer you soon get confused. You will have to answer the typical mobility questions such as:

- Which platforms to support – Android, iOS, Windows?
- Should you develop hybrid or native mobile apps?
- Should you go cross-platform?

There are many platforms to cater to and a lot of options to choose from. Native mobile app development will need separate teams for Android, iOS and Windows. Hybrid lets you use a single team and build using HTML/JavaScript/CSS technology. But hybrid apps may be more difficult to scale, compared to native apps.

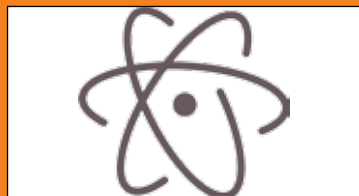

In this article I’ll introduce you to a new framework by Progress called NativeScript. In the coming sections you

will find a brief overview of NativeScript, addressing some of the key questions such as What, Why and How with regards to NativeScript.

What is NativeScript?

NativeScript is a technology which lets you develop truly native mobile apps with just JavaScript as a language. Hence the name NativeScript. If you are coming from web background, believe me when I say that you are already a native mobile app developer. NativeScript is how you build cross-platform native Android/iOS apps without web views. You can use plain vanilla JavaScript or TypeScript (which is my personal favorite) or the newly released AngularJS 2 from Google. You style your app using CSS, create UI using XML and use NativeScript provided UI components. You get truly native UI and native performance. NativeScript provides 100% access to native APIs via JavaS-

*Coding Matters

*Atom 1.11 released

>>Free and open source code editor updated to 1.11, with performance and stability improvements.

<http://dgit.in/Atom111>

*P Open-sourced

>>Microsoft open sources platform for asynchronous programming in IoT and distributed services.

<http://dgit.in/POpNsrc>

*Yarn for JavaScript

>>Open Source JavaScript package manager released by Facebook and Google.
