

Cast FB videos

After the recent update, Facebook now lets you cast your videos onto the big screen via casting devices. <http://dgit.in/CastFBVid>

Focused on 'BitTorrent Now'

BitTorrent says it will remain focused on the media spaces, including their streaming service – BitTorrent Now. <http://dgit.in/BitTrNow>

Six hidden features in everyday computing

Applications and websites that we use almost every day have some really nifty tricks up their sleeves!

Arnab Mukherjee
arnab@dgit.in

Whenever a new product or service launches, it comes with a huge list of services and features that aren't always quite well known. Even when subsequent versions are launched, it is only a specific feature set that is most advertised, leaving quite a few capabilities hidden. That does not mean that those features aren't useful. In fact, some of them are way too useful to remain hidden.

Be it the heavily used WhatsApp and Facebook, or the comparatively less used Tata Sky, most gadgets and software do have some tricks up their sleeves that can only be known if you have experimented a lot! Or, if you happen to have this list.

As if Dropbox wasn't useful already!

Dropbox (and BitTorrent)

Sometimes, two seemingly unrelated software come together to provide some highly useful functionality. And in this example we have Dropbox and BitTorrent

doing that. In a situation, where you would like to schedule a torrent remotely, you may not want to or be able to use a third party tool or even a supported remote scheduling feature for various reasons. In such a situation, a combination of Dropbox and BitTorrent can come in very handy.

If you're familiar with the Dropbox environment, you would know that it syncs all your files within Dropbox on all your systems including a desktop, a smartphone and more. So, within Dropbox, create a folder for your torrents.

On your desktop, open the BitTorrent client of your choice (most likely to be uTorrent) and go to Options->Preferences->Directories. Under the 'Location of .torrents' section, check the box next to 'Automatically load .torrents from' and then browse the directories to choose the torrents folder under the Dropbox folder on your system.

Now, whenever you add a file to the torrent folder in your Dropbox, the same file will appear on the same folder on your desktop. As a result, it will be added and started on your BitTorrent client. This scheduling feature is very useful if you're already a Dropbox user and are familiar with how it works. Even otherwise, this is a handy way to get a download done almost right after it comes out.

WinZip and other file extractors

Sometimes, you need to extract images from a word document. For example, when a colleague sends images, meant to be sent separately, as part of the document *cough*Mithun*cough*. In such a situation, rather than cribbing at your

colleague, take advantage of a really useful hidden feature in WinZip.

First, make sure that the Word file is a .docx file. If it is not, then open it in MS Word and save it as a .docx file. Once you have the .docx file, rename it to change the extension to .zip. Now right click on your file, whose icon has changed to a WinZip archive, and extract the contents wherever you need them. The contents here are some folders. Under word->media you can

Probably the least paid for software in the world.

find all the images contained by the original Word document. It's almost as if WinZip (or MS Word) deliberately has this trick hidden up its sleeve waiting for a better day to reveal it.

WhatsApp

WhatsApp is one of the most widely used instant messaging applications around the world. And due to this large user base experimenting with everything on it, most of its features, hidden or otherwise, are quite well known to many. But, there are people who haven't found out everything about it yet! For instance, WhatsApp has a mechanism to bookmark messages by starring them in any chat.

To do that, first, open a chat and go to the message that you want to bookmark. Now touch and hold that
