

Debut on iMessage

Pandora now lets you share tracks and radio stations within iMessages, one of the first music streaming apps to do that. <http://dgit.in/iMsgPandora>

Gold Edition TabPro S

Samsung has launched a flashier Gold Edition of the Galaxy TabPro S tablet priced at \$999.99 <http://dgit.in/GldTabPro>

Feature

message till it gets selected. Then tap on the star icon in the header that appeared upon selection. This 'star's the message. To navigate to it next time, open the chat and tap the three dots on the upper right. Then open 'View contact'

WhatsApp

In its race for more features, WhatsApp might eventually fail.

– 'Starred messages'. Here, you can see the starred messages and tap on them to navigate to their position in that chat.

WhatsApp's blue ticks let you see if your message has been read. Along with that, WhatsApp also lets you know the exact time when it has been read. In an individual chat, long touch on any sent message, and then tap on the 'i' icon. You will see the exact delivery and reading time. In a group chat the same information is shown for each member. As in, who has read it when, and if they haven't, when it was delivered to them.

Google keyboard (or any additional keyboard)

Autocorrect and dictionary suggestions have made life a lot easier for us. In fact, it's probably these two features that have driven texting to the cultural phenomenon that it is now. And yet, there are features that we aren't really using. For example, haven't you ever wished for a handy way to enter frequently used longer pieces of text using a shortcut from your smartphone keyboard? Guess what – there is a perfectly normal way to do that.

Take Google keyboard as the keyboard here. Go to Settings>Language and Input>Google Keyboard to open Google keyboard settings. Once there, open Dictionary>Personal Dictionary and select the language within Google keyboard that you want to enable the

shortcut for. Then, in the screen that opens, hit the '+' icon and type your word along with the intended shortcut. Currently the word/phrase length here is limited to 48 characters. Once you're done, every time you type the shortcut, your original text will appear as a suggestion for it. This could be your email ID, a particular number combination or even a frequently used email signoff.

YouTube

Since its inception, YouTube has trapped many of its users in its alluring and enticing labyrinth of cute cat videos and bizarre feats achieved by humans. Well, that might have been a bit over dramatic, but that doesn't really change the fact that YouTube is hugely popular and so are its nitty gritties. I mean, why else would YouTube add a statistics overlay feature and call it 'Stats for nerds'?

There are chrome extensions and third party websites that let you do almost everything with a YouTube video, from downloading the videos, identifying the songs in a video or making GIFs out of any video. But unknown to most, there are certain features within YouTube that are really simple and make the video watching experience quite convenient for most of us.

If you want to skip to a general area in the video, YouTube lets you do so with the number keys on your keyboard. Keys from 1 to 9 take you from 10% to 90% of the video respectively, while '0' quite obviously takes you to the beginning of the video. But in case you want this to be more specific, there is another way to go about that. At the end of the URL for the video, add #t=<time> where <time> is any specific value of time within the length of the video, for example 1m or 3m23s. Then

The video sharing platform has some rarely used features.

press enter to seek to that point on the video directly. If you enter a value greater than the length of the video, you are greeted by the end of the video! This feature is very useful for situations where you want to share a specific portion of the video without sharing what comes before it. Also, right clicking on the video and clicking 'Copy video URL at current time' does the same thing.

Gmail

These days almost every website, regardless of its product or service, requires you to sign up with them to avail the same. If you are one of the patient ones and don't share your social network login, you inadvertently sign up with your email ID. Now this is all well and good when the website is 'trusted'. But in most cases, your email ID becomes part of a massive database

Detecting spam is a major issue and this one solves that.

that pretty much becomes a shared resource among various companies and voila! You now have truckloads of fresh spam.

A specific feature in Gmail allows you to detect the data leaking traitor behind each spam email. When you sign up with your email ID, e.g. name@gmail.com, just add a suffix after the ID and before the '@' symbol, e.g. name+SUFFIX@gmail.com. This does not change the email's destination and it still lands up in your inbox, but a quick check in the address fields will show you that the email was sent to the ID including the suffix. Now, when this ID is shared to an unknown company that sends you spam, you can quickly look at the address fields to know which service shared your email ID and take appropriate action against them. If you haven't done it already, make it a habit now!
