

Save every image on a web page

If you visit a link where you want to save all the images listed on that web page, Mercury Browser makes it quick. Such scenarios occur when you visit an image rich website and want to save several of the images on it. The plugins tab includes a Gallery Mode which pulls all the images on the web page, where you can select the ones you need and download them. This saves time in individually selecting every image and saving it.

Use a small web browser

Low-end phones fall short on storage space and the default browser only includes the barebone features to surf the web. Additional features costs you a lot of space when using other high-end browsers, but with the APUS Browser, you can get the regular ones such as ad blocking, offline reading, night mode, etc. in under 2MB.

Play Adobe Flash content

Adobe Flash was discontinued but that hasn't motivated several websites to update their content, making it incompatible with newer browsers. Puffin Browser

makes sure that all the Flash content is still playable through their remote servers that act as a medium to enable support.

Save data while browsing

If you're on a tight budget on a data pack, or have poor connectivity in your area, it's wiser to opt for a browser that optimises web pages by using less data. Opera Mini has been ruling this area for a very long time and still they are going strong. The 'Extreme Mode' will ensure that the basic website is loaded while compromising on rich content and sometimes, even making it difficult for some webpages to work properly. But at the end, it gets the job done based on the first two parameters mentioned.

Custom search in other websites

There are times where you want to search for content on specific websites and not just Google. Rather than using search queries, Mercury Browser includes quick buttons to directly search on websites such as Amazon, Wikipedia, YouTube etc. This feature comes up when you

tap on the search bar, where you can toggle between the other websites. For quicker access, you can also add them as a notification bar through Notification Bar Options > Favourite Search Engines. If you can't find the necessary website or search engine, you can manually add it through Search Engine Options > Search Engines > Add Search Engine and entering the title and URL.

Connect to the Tor network

If you're a paranoid user who wants to stay completely anonymous on the internet, then the Tor browser must be your default desktop app. It's also available for Android in the form of Orfox which is

built over Firefox. You will also require the Orbot proxy app to connect using the Tor proxy servers, ensuring complete anonymity. Still under a Beta phase, the app keeps getting updates incrementally.

Verify what websites are tracking

Websites are collecting a lot of your information through cookies and the regular mobile browsers can't scan any of that data. The Ghostery Privacy Browser does exactly that and lists down all the trackers active on the websites you visit. It's completely upon you whether you want a few trackers to be active but if you hate any kind of tracking, you can switch them off in one tap.

View two webpages together

There must have been times where you wanted to open two web pages at a time when you needed to refer to some article while reading another. Although this can be done by switching tabs as you read, but a better way is to have a multi-window panel. Atlas Web Browser includes this very useful feature in its paid Atlas+ add-on, which is especially good for larger screens.
