Creative Aurvana ANC On-Ear

Decent audio, but overpriced

The Creative Aurvana ANC on-ear headphones aim to bring active noise cancellation to a more affordable pricing. At ₹10,999, the Aurvana ANC brings a mirror finish to the exterior of the earcups. It may resemble the more premium Bose QuietComfort 35, but in terms of audio performance, is quite different. This is a mixed story, as the bass performance is actually quite decent.

The lows are clear and powerful, along with good distribution of sub-bass and mid-bass frequencies, as is evident when you listen to Where are they now by Mr. Big. The clean and powerful bass is accompanied

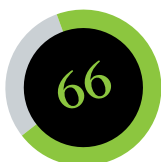

Price
₹10,999

by reasonably clear mids, although there is a distinct lack of details here. The mids sound rather flat, and there is a definite lack of flair and texture here. The sense of warmth is somewhat missing, although the soft, muted highs are yet again a pleasant surprise.

Soundstaging is not the most elaborate, yet another drawback of the headphones. The noise cancellation is rather basic, with the headphones using a single AAA battery to provide NC. It does not perform that well, either, and is miles behind the likes of Sony and Bose. The build quality is not too impressive, but the light weight may please many.

Overall, while the Creative Aurvana ANC is decent in many areas, it is not the most vibrant and consistent headphone we've experienced. Buy it only if you want noise cancellation within a limited budget, otherwise there are more competent options out there.

Moto G4 Play

Not the best of Moto

The Moto G4 Play is intended to focus on performance, leaving the Moto E3 Power for battery hogs. However, in terms of performance, it is not the smoothest. Regular apps open and switch between each other with noticeable split-second delays, and heavier apps show distinct stutters. Heavy games are not unplayable, but you will have to bear with distinct frame drops.

The 8MP primary camera is not a great shooter, as it struggles to produce vibrant colours and details. The camera focuses reasonably fast, though, and although the colours produced are not vibrant, they retain the original

Price
₹8,999

colour tone as the subject. Saturation levels are low, and details are low in bright and low light conditions alike, which isn't ideal.

The display is somewhat dim, which affects sunlight legibility. It also makes the smartphone look dull on overall terms. Touch response is fluid, and the near-stock Android interface works in favour of the phone. The phone retains a signature Moto look, with a smooth textured back and rather large display bezels. The look is simplistic, but is no longer appealing.

The 2800mAh battery will see you through about 15 hours of average usage. To sum up, the Moto G4 Play falls short to the likes of Lenovo Vibe K5 and Xiaomi Redmi 3s Prime in the sub-10k segment. Buy this only if stock Android and brand value continues to remain your priority.
