

Airportraits photoseries

Mike Kelley expanded the idea of stitching together hundreds of pictures of aircrafts taking off. <http://dgit.in/Airportraits>

LeEco enters US

LeEco has launched four TVs in total, along with 85-inch 4K TV for US, along with a set-top box <http://dgit.in/LeEcoUS>

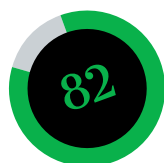

Moto Z

The swagger is back

The Moto Z is a true Moto smartphone. It carries with itself the swagger of the classic Motorola gems – particularly the Moto Razr and Moto Slvr. At 5.19mm, the Moto Z is all metal and glass, with Corning Gorilla Glass screen.

The particularly large camera bump with the embossed 'Moto' logo is a bit too large, but for the image quality it produces, it's worth it. It also serves the purpose of fitting the Moto Mods – a wonderful proof of concept for modular smartphones. The gold pin connectors at the bottom of the rear panel is the snap-on point for the mods. Of the ones we tested, the Hasselblad True Zoom Moto Mod is one of the most notable enhancements to smartphone camera technology ever. It presents its own image sensor, along with an f/3.5-6.5 25-250mm 10x optical zoom lens, hand grip, physical shutter button and zoom toggle, and a Xenon flash. It is typically a first generation product, and what it really adds is optical zoom. The image quality is certainly not a notable upgrade over Moto Z's

Low light: Hasselblad True Zoom (left), Moto Z (right)

own camera, and in low light, the smartphone itself shoots better photographs. Over time, we expect a wider aperture lens with better quality and a larger image sensor with the True Zoom. We are also testing the JBL SoundBoost mod. Here, too, while it is notably louder than any phone can ever get, the audio quality is not one to boast of. There is plenty of distortion, and the speakers themselves sound a bit hollow.

These mods, though, can be a great prospect going forward. Talking about performance, the Moto Z is a smooth performer. All regular tasks run without any blemish, and when you take on hardcore gaming, the smartphone delivers with ease. Benchmark scores reveal weaker performance than the OnePlus 3, and that is possibly because of Moto throttling the processor's highest speed to control heating of a phone with such a thin chassis. After 30 minutes of gaming, you get the first signs of throttling with some frame drops. But for practical purposes, the Moto Z is as good as it can get.

The display is bright and vibrant. Mobile games look crisp, and videos also retain original colours with high sharpness. The phone's default camera is adept at photography, shooting photos with good details, decent colour accuracy and good noise reduction. Low light performance is very impressive, with the phone managing light very well. Shooting 4K videos is convenient, and we could record over 7 minutes of 4K 30fps videos without any hint of a glitch. The UI is clean, uncluttered, with no real bloatware to crib about. The battery delivers 491 minutes on PC Mark, which is barely average. In real world, with 30 minutes of video, music streaming and gaming each, along with the regular array of browsing, messaging and email, the Moto Z lasts for a little more than 12 hours.

Optical zoom v. Digital: Hasselblad True Zoom (left), Moto Z (right)

Taking everything into account, the Moto Z is among the most innovative, fun smartphones to use. Moto Mods is a great concept, and will hopefully grow into a bigger ecosystem. The phone also gives fluid performance, a good camera, sharp display and an uber premium build.
