

Pixel Wallpaper pack

Here are all the wallpapers bundled along with Google's latest Pixel phones, one feature that's not exclusive to Pixel phones. <http://dgit.in/PxlWlpr>

**Gboard update**

The Google Keyboard for iOS has been updated for 3D Touch and iOS 10 emoji support. <http://dgit.in/gBrdUpdt>

DUAL-CAMERA SHOOTOUT: SHOOTING WITH TWO CAMERAS

Dual camera smartphones are slowly growing in number, so naturally, we had to see how they have been developing! Here, we try out the Huawei P9 and the Honor 8 alongside Apple's latest flagship, the iPhone 7 Plus, to see how capable they are...
... and which one's best!

souvik@digit.in

Dual camera smartphones are a steadily growing breed. A number of popular present day smartphones already flaunt this feature, and still many more are reported to house two cameras on their backs come 2017.

But, what really makes dual-camera on a smartphone so special?

First brought to the mainstream market by the likes of Honor, with the Honor 6 Plus and QiKU, with the Q Terra, (although technically the HTC Evo 3D was the first smartphone with a dual-camera system) dual-camera setups on smartphones were initially conceptualised to simulate depth of field for smartphones, lending soft, blurred backgrounds similar to how

more expensive cameras would produce. Engineers soon figured a way to process two separate images from the two cameras, and use separate colour and light data from each to create a final image that is far superior in quality.

That is the essence of dual camera setups on smartphones. The three smartphones that we have in our comparison here include the Leica SUMMARIT lens-powered Huawei P9, its sibling of sorts, the Honor 8, and Apple's latest, greatest flagship, the Apple iPhone 7 Plus. It is interesting to note that while the Huawei P9 and Honor 8 use two cameras to capture colour and monochrome data separately, the iPhone 7 Plus takes a completely different approach. Here, the two cameras, alongside providing additional data to increase details and

contrast of photos, have different focal lengths, and Apple uses this to present an optical zoom mechanism of sorts, without moving lens elements.

However, is 2x optical zoom really worth the hype? Or is it Leica that aced the dual-camera setup with the Huawei P9? Or is it the Honor 8, an underdog of sorts here, that delivers surprisingly good results? This is what we are going to find out in our three-way shootout of the latest dual-camera smartphones to have launched in India. Our parameters of testing includes how well the cameras fare in terms of details, sharpness, colour accuracy, white balance, image noise, and bokeh. Unfortunately, the LG G5 was not available at the time of our testing, which would have otherwise made for a more compelling shootout.

Let's roll!
