Teams is a new chat-based workspace integrated in Office 365 for group/team chats. <http://dgit.in/mctms>

Sony MDR-XB50BS

Run to the beat

The Sony XB50BS is aimed at fitness enthusiasts looking for an affordable pair of in-ear headphones. In terms of the sound, the XB50BS delivers good, tight audio, with loud bass, clear mids and soft highs. Good loudness and clarity of audio combines with warm, sweet timbre, and the XB50BS delivers a full-bodied sound that is good to hear.

Since this belongs to the Extra Bass lineup, bass is clearly the priority here. This works for fitness enthusiasts, as the loud, clean and tight bass thump helps you run along to the beats of your favourite tracks. Sub- and mid-bass

Price
₹4,905

ranges sound very well detailed, along with distinct notes, a dash of rhythm and warmth. The mids do sound slightly attenuated owing to heavier bass, often sounding thin in a number of tracks. They're still well detailed and clean, but lack emphasis.

Highs are pleasant, and are slightly softened to cut off piercing sharpness of audio. The highs have a nice flourish, and even soundstaging is decent here. In terms of build, it is somewhat bulky, but the large exterior units help keep the earpieces in place during jogs and exercises. Connectivity remains stable till about 25 feet, and battery life lasts for 6 hours and 45 minutes on average.

At this price, the Sony XB50BS is one of the best wireless activity in-ear headphones.

Samsung Galaxy On NXT

Decent, but underwhelming

The Samsung Galaxy On NXT is aimed at providing simplicity and ease of usage. Priced under Rs. 20,000, the octa-core Exynos 7870 SoC coupled with 3GB RAM and 32GB storage delivers acceptable performance. Regular usage apps load smoothly, albeit with a split-second delay that thankfully is not disruptive to usage. Graphic-intensive games run well, too, for 15-20 minutes, although there are notable occasional frame drops.

The 5.5-inch Full HD LCD display is crisp, bright and vibrant, offering decent picture quality. However, the UI does not look finely refined, although it adds a few functional elements

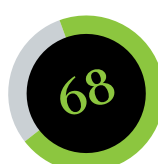

Price
₹18,490

like Outdoor mode and audio equaliser. The 13MP primary camera is a disappointment. While brightness and shutter response are good, focusing is slow, and the level of noise and details even in bright photographs ruin most frames. Image details are low, and sharpness goes for a toss.

The build quality is neat and simple, and will please most who are looking for a large screen smartphone with a slim profile. The fingerprint sensor is fast, although the home button feels somewhat tacky. Battery life is average at best, delivering 14 hours of standard usage time, and falling lower on heavier usage.

All of this combines to make the Galaxy On NXT fairly decent but weaker cameras and battery life does not make it recommendable.
