

Dell's Smart Desk PC

Dell is getting ready with a "Desk PC" that will likely take on Microsoft's Surface Studio in 2017. <http://dgit.in/dellldskpc>

"Fake news" denial

Zuckerberg claims that 99% of the news in Facebook is authentic. <http://dgit.in/fbUSnws>

Touched by tech

THE TECH CURE

Technology of all shapes and sizes is giving humans a new lease on life.

Arnab Mukherjee
feedback@digit.in

The essence of any science is to solve problems. Whether it is a conceptual problem, a social problem, a numerical one or an actual real life problem that will directly benefit human lives. When it comes to technology, most of the times the focus is on solving the problems of speed and size. But there is another aspect of creating technology that, if you look at it, makes you realise that the shiny metallic world of tech also has a human heart within.

Technology is not always about the fastest, smallest and sleekest stuff out there. The essential purpose of technology is to make our lives easier and let us do things that weren't possible before. And when it comes to the world of health, technology has brought it a long way and it seems

to have no intention to change that. Actual devices being made around the world are pushing medical science to new frontiers that were incomprehensible to humans before now.

Exoskeletons

If the word 'exoskeletons' directly conjures images of battle-ready gun-toting armour that humans don to go after each other's throats, we don't blame you. But then, you'll be pleasantly surprised to know that modern technology has made exoskeletons of a different kind a reality too. Modern day exoskeletons are helping the disabled to walk again and are also helping make physical work easier.

Take ReWalk for example. This exoskeleton, officially known as the ReWalk Personal 6.0, is built to help disabled people walk again. It does so by sensing changes in the centre of gravity of the user and initiating

a step based on that. And the origin of this exoskeleton lies in a problem. "The origins of ReWalk come from the inventor, Dr. Amit Goffer. Dr. Goffer, who trained at the Technion in Israel as well as in the United States, was injured in an ATV accident which left him paralysed from the chest down," says Mela Ikanovic, Director of Market Development EU & Asia. "Realising the technology of the wheelchair had not been markedly improved upon over hundreds of years, Dr. Goffer set out to develop a technology that would allow individuals with spinal cord injuries to stand and walk again. He developed the ReWalk robotic exoskeleton, which has helped individuals around the world to regain the ability to stand and walk and return to many of life's activities before their SCI."

With this exoskeleton alone, there are more than 400 people around the world already who have regained
