

Adult FriendFinder hacked!

Adult dating service FriendFinder reported that their network was hacked exposing over 400 million accounts. <http://dgit.in/AFFhckd>

"Secret" is back!

David Byttow the former co-founder of the sharing app posted "Secret V2 is coming. It's too important not to exist." on Facebook. <http://dgit.in/sctrv2>

ReWalk self-balances the user

the ability to walk. In fact, this is not merely an assistive technology that gets you dependent on it. The ReWalk program can be calibrated to act as a rehabilitative procedure as well. And they aren't resting at that. ReWalk plans to build a soft suit exoskeleton that would help stroke patients and people with other mobility issues.

Another exoskeleton company that is oriented towards such purposes is suitX. While they also have an exoskeleton to help people with disabilities to walk, named Phoenix, they recently launched MAX, a modular exoskeleton targeted towards factory workers who put themselves through a lot of physical stress everyday. This exoskeleton has three modules – backX, shoulderX and legX which target those areas respectively. To get a better understanding of how

effective this is – a recent study by researchers at the University of California, Berkeley showed the backX component of the MAX system augmented users with an average 60% reduction in muscle activities at four of the lower back muscle groups. This has the potential of saving a lot of lives in multiple industries where workers are at risk everyday.

Visualisation of reports

In some medical cases, doctors and physicians request a CT scan or an MRI or some other kind of 3D modality image. The results of such tests are multiple 2D perspectives that have to be put together to imagine a patient's anatomy. This particular leap actually brings in a scope for error and even slows down the overall treatment process at times. EchoPixel Technologies, a California based imaging company, wants to improve that process by using 3D imaging and VR. Their product – True 3D viewer – allows the visualisation of patient anatomy in open 3D space.

Quite like the HTC Vive arrangement, this system also uses cameras to track the head movement of the user and a physical stylus to let users interact with the images being displayed on a pair of glasses. You can imagine that in such a view, the physician will not be restricted to the perspective of a printed report and can instead freely orient the image to their needs. This could make a lot of things

easier for physicians, especially surgery planning. In similar lines, Surgical Theatre is a company that provides an entire suite of products that are VR enabled and deal with different aspects of medicine like scans and surgery.

Sensors and scans

Sometimes one of the biggest hindrances to proper medical care is the lack of proper medical equipment. Especially in remote areas, it is quite common to find hospitals or treatment centres that do not have proper machines to perform tests like EEG, ECG and more. Even if they can be obtained, there is often a lack of proper know-how or facilities to maintain them. On the other hand, almost

Now we have wearable EEG machines

everyone has access to smartphones. Moreover, smaller and cheaper devices are coming out with features like heart rate sensors. So is it really possible to find smaller substitutes for traditional scanning devices? Turns out there is and there are companies making them.

Muse looks like a really cool Bluetooth headset at first glance. In reality it is a wearable device that measures the rhythms of the brain, i.e. EEG. The device has been certified by multiple regulatory standards across Canada, USA and Europe. In functionality, it takes about seven measurements for sensors placed on the forehead, behind the ears and reference sensors at the back of the head. It also shares the data with the Muse app on your phone which can be used as a normal meditation exercise app. This is priced at \$249 and ships worldwide for free. Check out the prices of actual EEG machines and you'll know that this is definitely a step in the right direction, if not a replacement in itself.

Visualising reading reports will make diagnosis way easier for surgeons
