

the Kinect even happened. It didn't have the powerful hardware that the PlayStation or Xbox had, but that wasn't the point, because the Wii wasn't even trying to compete with the Xbox 360 or the PlayStation 3. As an added bonus, the Wii was also considerably cheaper because, obviously, the powerful stuff wasn't in it. So it comes as no surprise that the Wii managed to outsell the PlayStation 3 and Xbox 360, with well over a 100 million units sold so far worldwide. That's a very impressive statistic. It also tells you that gamers are willing to try out and invest in new things and Nintendo was the only one out there thinking outside the box. That is till the disaster that was the Wii U happened. Consider this, the Wii U sold only 13 million units in comparison to the Wii's 100 million. It was that bad. We needn't even say more but you know us, we're nice guys. We think the biggest problem with the Wii U wasn't the fact that it was a bad console. In fact, in itself the Wii U is a pretty decent console, it's not atrocious or horrible like the sales suggest. The main problem was the fact that Nintendo wasn't exactly clear about what the Wii U was. Was it an upgrade to the Wii? Was it an add-on? Was it a brand new console? Well, let us answer that for you, it was a new console. With its own new and unique controller and exclusive games and whatnot, but consumers were obviously confused about that, and people tend to shy away from confusing consoles-upgrade-addon-things in our experience. Perhaps the Wii U would have done a whole lot better if they'd just called it the Wii 2. At least that way people would be able to figure out that it was a new console with its own games n' stuff. But naaaah, it had to be a confusing mess. Thanks Obama- Nintendo, thanks Nintendo. Anyway, they did attempt to rectify it two years later and actually state it was the successor to the Wii but it was too late by then.

So now here we are again, years later, and Nintendo has once again wowed the world with their out-of-the-box approach to gaming. The Nintendo Switch. And from the trailer it's quite obvious that Nintendo learned their les-

Remember the PSP? No! No you don't! The 3DS pretty much ruled the roost.

The Nintendo Wii carved its own niche in the console market so Nintendo knows what it's doing. And then the NVIDIA shield probably gave them a little nudge in the right direction. The two probably went on a candlelight dinner and the Switch was born.

son; they made sure that everyone knew well beforehand what the Nintendo Switch was going to be. We're pretty sure EVERYONE knows about it, the video showcasing the Nintendo Switch was the most trending video on YouTube for a week since it was released, and from the looks of it, people are very happy about it. While we're all hoping that the Switch turns out to be everything Nintendo is showcasing it to be, we're all skeptics over here at the lab. So let's not dally any longer and delve into what's known and yet to be known about the Nintendo Switch!

The Selling Point

These days when you think about the selling point of a console, you're thinking hardware, how powerful it is, and at what fps can it run games etc. What we do know about the Nintendo Switch is that it'll be powered by a new version of the Nvidia Tegra chipset which, Nvidia claims, packs the power of a desktop GPU. But we can all safely assume that it won't be nearly as powerful or even close to the best desktop GPUs we have in the markets right now. Now some might be deterred by this, you want only the most powerful GPU powering your console, we get it. But Nintendo has never been about being the
