

Origins

From plates to pixels, we trace the evolution of Cameras from their humble beginnings.

**Snapchat Spectacles**

The new Snapchat Spectacles are sunglasses that can record a 10 sec video, which can be uploaded to Snapchat. <http://digit.in/SnapSpec>

How digital tech

is changing the way music is made

From accidentally discovered machine sounds to holograms of long gone artists, technology is infusing itself into the very fabric of music.

Dhinoj Dings
feedback@digit.in

The 90s were a time period when, musically speaking, the world was kind of directionless— with mainstream musicians not quite sure how to take things forward from the disco vibe of the preceding decades. Meanwhile, on the technology front, the digital revolution happened in that same decade. And that certainly shook things up more than a little in the musical landscape. The shake up was felt most by those artists who were already set in the old ways. This meant that a lot of ‘veteran’ artists found the going tough. But on the flipside, the new wave of change also gave a younger generation of aspiring musicians the possibilities to create music which their predecessors would have killed for in their younger years.

And even now, technology is changing the way music is made and shared everyday. Internet has single handedly pushed music’s reach to new levels.

It’s interesting to look at how digital platforms change the way music is produced or recorded too. For one thing, the story points to the significance of embracing changes and what incredible things could happen when

you do so. Also, it gives some fresh insights into the interesting auditory landscape in which we find ourselves in the present day.

How affordable digital audio workstations change the art of making music

While the aesthetics of music have certainly been altered dramatically thanks to digital technologies, the main reason why a lot of music production has transitioned from analog to digital isn’t artistic. In fact, you can say that there are two main reasons: cost and convenience. While puritans argue that digital music-making sacrifices sonic purity, the aforementioned factors are also significant.

Now, there’s no argument that some of the vintage hardware is still unmatched— a \$40,000 compressor would still give the most modern technological innovations a run for the money. But the inexpensive abilities that digital tech gives you can also make the music sound great. And as any sound engineer worth his salt would tell you, it’s not about the gear but about how you use it.

The key aspect is to apply certain smoke and mirror tricks that would trick your ears into thinking that the sound that you’re hearing comes from a super-expensive setup. And the good

news is that digital tech gives you a whole bag of tricks to play with.

The DAWs

These days digital audio workstation (DAWs) software from brands like Logic, Pro Tools, Nuendo, Cubase and Ableton are widely used in recording studios. In earlier days, the recording process was restricted to a small number of people – the biggest reason being, of course the cost. But now, thanks to the power of software, the modern music makers needn’t spend too much on huge mixing consoles, high-end compressors and endless rows of expensive equipment. Software like Garage Band— the free DAW that comes with all Apple computers makes things easy for the modern musician. Also, there are online DAWs like Indaba.

But it must be said here that the requirement for hardware depends on

DAWs - Bringing all the essentials to your table
