

USB-PD vs Quick Charge

Currently two quick charge standards (USB-Power Delivery & Qualcomm Quick Charge) compete and Google wants to kill one. <http://digit.in/PDvsQQC>

YouTube VR

YouTube VR is a standalone app first on Google's Daydream that turns all YouTube content into an immersive experience. <http://digit.in/youtbeVR>

Eastman launched the Kodak camera, which made photography as easy as it had ever been. A major boost to photography was the Kodak Brownie launched in February 1900 that brought the technology to the masses at an attractive price of \$1.

Colours

Efforts towards colour photography were ongoing while monochrome photography was being perfected. Initial results were plagued by the same concerns regarding prolonged exposure and volatile reproduction of the image.

The Kodak Brownie - perhaps the reason why photography is as popular as it is today

The first durable colour photograph was created by using red, green and blue filters and superimposing the images.

Inventors and brothers Auguste and Louis Lumiere commercially introduced the Autochrome plate method in 1907. This went on to become the first widely used method for colour photography. But it suffered from its own set of drawbacks in the form of longer exposure times and darker photographs.

What changed was the introduction of Kodachrome film in the 1930s. It captured the red, green and blue colours in three layers of emulsion and produced complementary cyan, magenta and yellow dye images in those layers. Now this could be used to obtain the original colours using subtractive methods.

35mm

Around this time, the same technology that was used to develop the initial photographic films was applied to develop 35mm roll films for cameras. A number of manufacturers were using

The first colour photograph made by the three-colour method suggested by James Clerk Maxwell in 1855, taken in 1861 by Thomas Sutton.

35mm films for photography since the beginning of the 20th century. The first 35mm cameras that were actually available to the general public were the Tourist Multiple in 1913 and the Simplex in 1914. Further development was halted during the first World War.

Post the war, Oskar Barnack, in charge of research and development at Leitz, further developed his initial pro-

TOTYPE 35-mm Ur-Leica camera and the Leica 1 was put into production in 1925.

Although competitors did bring out multiple models, 35mm was still out of the reach of the masses due to the pricing. It was eventually the launch of Argus A in 1936 and Argus C in 1939 that truly popularised the format. And it was around this same time that the camera industry in Japan began to take off.

Reflex action!

Historically, cameras had viewfinders. This was problematic because there

The Leica 1

was an obvious parallax error as well as misrepresentation in the final form. A lens would capture an image very differently than what you could see in the viewfinder. The solution to this was the ability to view exactly what the lens was capturing. And this was achieved through reflex cameras.

A single-lens-reflex camera uses a mirror and prism to let the photographer see exactly what will be captured. Initially, the camera was held at waist-level to take the picture, and the viewfinder was on top. There were a few initial popular models before and during World War II, namely the Ihagee Exakta in 1933 with a 127 roll film and the Kine Exakta in 1936, this being the first western SLR to use the 35mm format. But it was mainly post-World War II that the market received a lot of models, with their own innovations, in 35mm SLR format.

One of the most important post-war innovations that were seen on SLRs was the eye level reflex viewfinder. This came in the Hungarian Duflex in 1947

FIRST SELFIE

The first selfie

The first selfie ever taken will have to be the daguerreotype by Robert Cornelius of himself that he produced in 1839. He took the picture by removing the lens cap then running into the frame. Once he sat there for a minute he ran out and put the lens cap back again. This was also one of the first pictures of a person. Contrary to what you may think, self-portrait pictures have been common since the early 1900s.
