6) Display

The display settings allow you to use the expanded notification mode, which is a great feature if you like a lot of screen real estate. It hides the notification bar and the navigation bar, so you get a bit more space on the screen. You can also set various configurations for the display brightness and even the animations when you lock the screen. Some devices allow you to alter the backlight on the buttons. Per app customisation is also possible, letting you increase or decrease the size of the content in the app.

Advanced Power Menu adds additional options to the power button

7) Phone

Answering phone calls can be pretty boring the conventional way. What if you could just hold up your phone to your ear and have the phone answer the phone call automatically. Or knock on the back of the phone to reject a call when driving. You can even dictate how the mobile network functions, set it to change power delivery to the antenna in areas of low network. You can set it to change to 2G or use 3G when 4G has low network. You can also remove the very annoying Roaming symbol which pops up when you move out of your network circle.

8) Media

Here, you can add on to the functionality of the volume keys and set various options for how your device handles video or music. You can set the equaliser to reflect your music taste and it would remain the same across all the media apps you use. You would also be able to toggle the various volumes on the device such as notification, alarm and media volumes and set the threshold volumes for the headset and external speakers.

9) Launcher

While launchers on the Play Store do a pretty good job of offering various tweaks, some modifications can be done system wide to enable those

features across all launchers. One such is the desktop grid, which lets you set the size of the icons and the number of icons in your app drawer. You can choose between 3 and 7 rows and

between 3 and 6 columns. You also get the option to resize the widgets on the screen, a feature disabled by many apps.

10) Navigation keys

With the navigation keys, you can set additional actions based on taps. One tap on any navigation key performs a different action compared to two or three taps. You can add additional keys to add a screenshot button or

app shortcuts. You will also be able to change the vibration pattern and set the delay when pressing multiple times.

11) Miscellaneous

Miscellaneous tweaks contains all the actions which don't fall into the above category such as customising the recents button and modifying the screen to be more aesthetically pleasing, adjusting headset actions and tweaking some rare network settings.

As you can see, GravityBox offers so many tweaks for your device. You can get lost in these toggles over a couple of days, in your quest to make your smartphone truly yours. But do note, some of the modules can be malicious.

Greenify

If you've ever encountered a slow phone because of so many apps using resources in the background, you'll want this module. Greenify is available as a standalone app in the Play Store as well, but a lot of its features are crippled without root access. Greenify

helps identify apps and processes which are consuming a lot of resources and automatically kills the background processes when you lock your screen. It stops the background processes from waking the phone up when locked and this helps increase the standby time of the phone. The full version of Greenify, on rooted phones with Xposed automates a lot of these tasks. When you start up the app in the foreground, it works as well as any other app. To install Greenify, head over to the Play Store and install the version which needs root access.

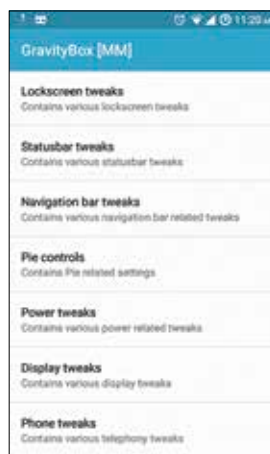

Dynamic notifications

Another interesting module is Dynamic notifications. If you've ever used one of Motorola's phones in the recent past, you'll know how good the lockscreen is. It displays a black screen with the clock and other important notifications which are actionable. Although Google already baked this into Android, the implementation is pretty shoddy and incomplete. You can now have all the features you wanted on the lockscreen and even customise whether the app icons should be square or round and even change the colour of the material displayed on screen. The app replaces your stock lockscreen and triggers it every time you pick up your phone or press the power button.

Other modules

There are thousands of modules available in the download section of Xposed and there are many more distributed online. These modules can

help you perform tasks which would not have been possible on stock devices such as controlling music playback from YouTube, bypassing country restrictions and more. We are strongly against piracy and would never advise our readers to perform tasks which might land you in legal hot water. These modules have to be used at your own risk. 

The various tweaks GravityBox can perform
