

Alfa Romeo Stelvio

"The Stelvio" is a new Ferrari SUV with Alfa Romeo branding which the company claims is the fastest SUV. <http://digit.in/ferariARS>

Bronx Grip

Bronx is a group communication handsfree device. It is also shockproof and waterproof. <http://digit.in/bnxgrp>

In today's episode: defective keyboards, mice and graphics cards

With a special cameo from mysterious automatic shutdowns, and a surprising debut of no internet access, we solve it all.

Q The keyboard wants to talk

Hey there, recently I purchased a new keyboard and whenever I connect it to my computer, it installs correctly. But when I type, the characters repeat more than once. For example, if I type 'a' the result would be 'aaa'. Now I replaced the keyboard with another unit but the problem continues. Please help, my OS is Windows 8.1 64-bit. I checked my USB port by attaching different USB devices and they all worked fine.

—Amit

A Hi Amit, since you've purchased a new keyboard we would drop the possibility of any liquid spilling over your keyboard. If the problem persists only with the keyboard you've bought, then the matrix or the keys could be defective and you should get it replaced until you have the replacement window open. If it's the same on other keyboards, then it's likely that your system has been infected with malware or your peripheral drivers are acting up. We would recommend you to do a quick scan with your antivirus tool and also with Malwarebytes for lurking malware. Also, manually update your peripheral drivers or download firmware upgrades.

Q Router vs Laptop

Hello,
I have a D-Link wireless router D600 and I use my laptop (Windows 10 Home) to connect. Of late, my laptop keeps showing connected but there's no internet access on it. My phone and other gadgets work fine on the network.

When I run the network troubleshooter it says that the default gateway is unavailable and that it's fixed. It keeps doing this. Kindly tell me what to do. P.S I have updated all my wireless drivers as well.

—Pranav

When routers drive you crazy!

A Hey Pranav, there could be several reasons for the 'default gateway is not available' error to pop up. The first step should be to reset your router manually so that it goes back to the default settings. If that doesn't work out, ask your ISP for your network settings that you can manually enter from the admin panel because sometimes, the router isn't able to fetch the WAN settings. Now, if these steps don't work, then you should uninstall your wireless network drivers from device manager. Make sure you download the wireless network drivers for your network card before. This will uninstall the existing drivers and Windows should replace it with its default drivers. Then you could manually install your drivers. To be sure, keep your firmware upgraded.

Q Slow-mo PC

I have an HP All-in-One 18-inch desktop

computer. The specs are AMD E1-1500 APU 1.5 GHz (two cores) with AMD Radeon HD 7310 on-board graphics card, 2GB of RAM and running Windows 10 Pro. I upgraded my RAM to 6GB as there was an empty slot. Recently, I installed Call of Duty Black Ops 1 and found out that it was running at 4fps. I thought that there was some problem with my graphics card. So, foolishly I uninstalled my graphics adapter driver from the device manager. After that my videos aren't running smoothly. I can't open the Start Menu properly. No Windows app runs smoothly. Everything hangs and lags even Turbo C++. So I just want to know that is there any solution to this? And if yes, then what? Please help me.

—Sayan

A Hey Sayan, since you have an APU, your PC should run properly even though your graphics card's drivers aren't installed. There could be a problem with your APU drivers as well. Try to manually download the latest drivers for the APU and graphics card in some other PC and then struggle your way to reinstall it on your system. Trust us, when the problem is solved your struggle will seem worth it!

Q Dashes and dots

Hey,
I had recently bought a Radeon NITRO RX-460 4GB version, and when I plugged in the graphics card after installing the drivers provided in the DVD, it started showing green lines and dots on the screen. Hope you can help me solve this problem.
