bootloader, read through it and when ready, confirm using volume keys to navigate and power button to enter.

And the first step is done. Now we move on to installing a custom recovery to install yet another module.

Installing a custom recovery

A recovery is a partition in the internal memory. Its console enables features like factory resetting the device and

For this workshop, we will be using TWRP (Team Win Recovery Project). Visit the TWRP website [<http://teamw.in/Devices/>], in the Devices page is a list of devices and a convenient search

bar. Find the recovery image for your device and keep it in a folder easily accessible. Remember both the path of the .img file and its name.

Go back to the command prompt and type `adb reboot bootloader` and hit enter. Let your device restart. Once the reboot is complete, type `fastboot flash recovery file-path.img`. Filepath would be the path to the recovery image of your device. It should be something like `C:\twrp-3.0.2-0-athene.img`. Hit enter. When done, type `adb reboot recovery` to reboot and launch TWRP. Then you'll directly boot into the TWRP custom recovery.

For the next two features, we'll require the Xposed Framework to be installed in your phone, which has root access obviously. If you want more details on how to install Xposed

Framework on your phone, refer to the previous Workshop which entirely talks about Xposed. The modules mentioned below provides the new notification and quick settings, a new design of recent apps, summarised settings view, quick switch and the new navigation bar.

Android N-ify

This module brings in the little Nougat features on any Lol-

lipop and above device. You can search for it under the Downloads section of Xposed. The module looks ambitious since it's seeing regular updates from the developer. For now, the features you

get include viewing subtitles in Settings, notifications and quick settings, and double-tapping the recents button to switch to the last app. Oh, and did we forget to mention that N-ify also incorporates Google Assistant in your phone? Yes, although it's still under heavy testing, you can try it out if you're feeling brave enough. Once you

install the APK, you'll have to browse to Xposed and enable the module.

Nougat Navigation Bar

You don't necessarily need Xposed to get this feature but if you have already installed, then it actually makes it easier. Search for 'Nougat Navigation Bar' in the Downloads section and install it, and you're done.

The other method for non-rooted users is to download Layers (<http://dgit.in/LayersManagerAnd>) from the Play Store and install the N Navbar - Layers/RRO theme directly. Then open up Layers > NNavbar and apply the theme.

Cyanogemod users can install the N Nav Bar CM12/13 asset from the Play Store and then apply the asset from the Cyanogemod Theme Engine.

And this concludes our workshop to turn your non-Nougat device into something close to a Pixel device!

Xposed gives you access to more useful modules

installing official OS ROMs. The purpose of installing a custom recovery is to get more features than the stock recovery to make installing updates and flashing modules easier.
