**THE INTERNET BOOMDOWN**

Chattanooga, the southeastern Tennessee city has transformed itself into a startup hub, from what could have been another failing mid-sized city. This city was saved by its gigabit-per second fiber internet network, way before Google Fibre came in.

# BlackBerry DTEK50, DTEK60 first impressions: Neither here, nor there

The two new BlackBerry phones run on Android and claim to be more secure than others, but there's little that really grabs your attention.

– By Souvik Das

In the present world of smartphone-ruled technological innovation, much of the gadgets that become commercially successful flaunt an element or two that really grabs your attention upon first sight. Take for instance the dual-edge Samsung flagships, two cameras on the Apple iPhone 7 Plus, modular attachments with the Moto Z, and so on. BlackBerry, though, seems to be working on a different note.

Recently, the company announced that it will not be “making” its own phones any longer. True to the declaration, the new Android phones, from the company that once ruled the world have been manufactured by TCL. Many purists and veterans may not regard these as “true” BlackBerry phones, and that is not entirely based on face value. The DTEK50 and DTEK60, BlackBerry's new Android devices, do not radiate a sense of swagger and pride the way they once used to. It is mostly this that keeps circulating in your mind, when you try to analyse how the two BB smartphones truly are.

BlackBerry's entire focus is on software - they want to bring in the versatility of Android along with the secu-

rity of communication that every BB device was once known to include. And while on paper they really seem to have cracked the code, the devices are far from alluring otherwise. In terms of the make and design, the new phones are built reasonably well, but do not give the air of truly well-built, sturdy gadgets. Both the phones are quite light and slim, which

in turn aid ergonomics. The DTEK50, in particular, flaunts a 5.2-inch display, with narrow borders and a slim profile coupled to a textured rubber back. This design makes the phone feel good in hand, and I even found one-handed typing to be quite smooth.

The BlackBerry DTEK50 is the less expensive of the two smartphones
