HANDS ON: SNAP SPECTACLES

Snapchat recently unveiled its first consumer hardware

product, the Spectacles, a pair of glasses that you can record 10-second videos with, but would work only with the Snapchat app. Here's what Snapchat has for you now, before it disappears!.

EMOJI ETIQUETTES

We all love using emojis, ever since they started playing a big role in our day-to-day Instant messaging communication. Quite a few have struggled in putting it to use it correctly, as its time to learn and adopt some emoji etiquette or stop using them completely.

MEETING UP MORE WOMEN

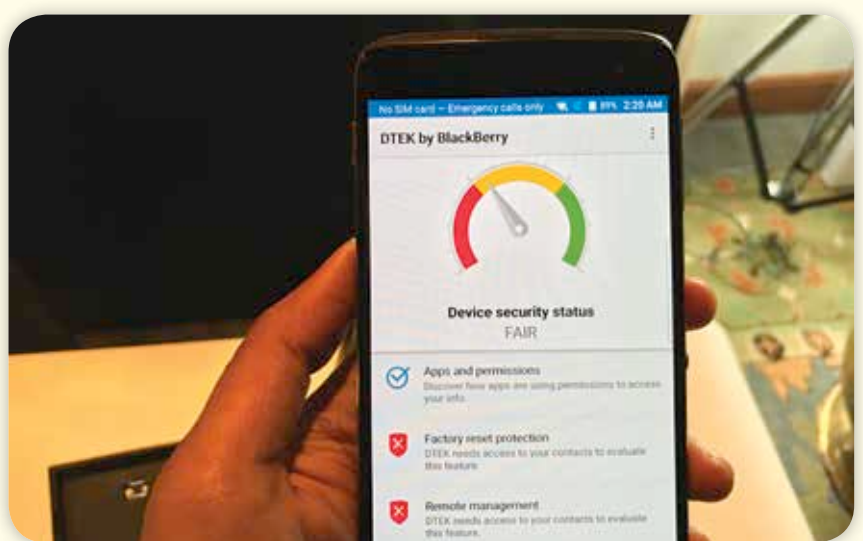

In the past three years, Scott Heiferman, CEO and cofounder of

Meetup decided to reshape its team of people who run Meetup, to add more women to his predominantly male-filled company. Here's how it all started and how they accomplished it.

launched. Along with the aforementioned display, it is powered by a Qualcomm Snapdragon 617 SoC, 3GB RAM, 16GB internal storage (expandable up to 200GB), a 2610mAh battery, 13MP primary camera, 8MP front camera with front-facing flash, and Android Marshmallow. Apart from the acceptable build quality and good ergonomics, the DTEK50 does not feel the most fluid in terms of performance. In the short time that I spent with it, the device seemed to take split seconds too long in opening applications, and the touch response was also not as fluid as we are used to these days.

The BlackBerry DTEK60 is a flagship smartphone, powered by the Qualcomm Snapdragon 820 SoC, 4GB RAM, 32GB native storage expandable by up to 200GB, 3000mAh battery, 21MP primary camera, 8MP front camera and Android Marshmallow. On paper, it is at par with most other flagship devices out there. We did not get a chance to run benchmarks, but upon initial inspection, the DTEK60 seemed fast enough. Standard operations seem fluid, and everything from Google Maps to Facebook and Camera opened swiftly. BlackBerry has also included Quick Charge 3.0, and the front has a 5.5-inch,

AMOLED display with screen resolution of 1440x2560 pixels.

The DTEK security suite makes use of Android Marshmallow's enhanced security features, and collects all the security features of the two phones under one roof. You get encrypted storage, screen lock, app permission toggles and more, most of which are standard on any Android Marshmallow device. The enhancements are in how BlackBerry aims to restrict background feature access by certain apps to enhance your security and privacy. For instance,

if an app installed by you happens to request for an unnecessary permission, you can disable it, and even black flag it. Flagging this will switch on notifications, from where you can monitor when and where did the apps access the settings. This, essentially, is the most practical security enhancement that the two phones include.

To sum it all up, BlackBerry may find it a bit difficult to sell its phones based practically on just one security enhancement. It may still find takers who are paranoid, but that percentage is possibly lower than takers for dual-camera setups and modular designs. The phones are priced reasonably well, given BlackBerry's pricing trends, which makes it more plausible for brand-conscious buyers to opt for either of these.

The BlackBerry DTEK50 goes on sale from next week, and the DTEK60 will sell from early December. It remains to be seen how they fare.
