Canon EOS 5D Mark IV

Versatile, fast, powerful

The Canon EOS 5D Mark IV is an attempt to bridge the gap between consumer-friendly full frame cameras and professional ones by fusing prosumer features into a popular lineup. The upgrades here include a newer, higher resolution image sensor with Dual Pixel technology, 4K video recording, a new auto-focus mechanism, a high resolution display with touch input, built-in WiFi/NFC/GPS, and a more robust overall chassis.

In terms of performance, the new 30.4MP full-frame Dual Pixel sensor is meant to be an optimum balance between the high resolution sensor on the EOS 5DS and the colour accuracy of the 1DX Mark II. The level of details here are much higher than before, and there is a defining sharpness in photographs, even in JPEGs. The sharpness in RAW results are a tad too high, but this leaves greater control and room for processing JPEGs.

The high dynamic range and low noise floor of the camera combine to produce impressive details and well-retained sharpness even in low light and high ISO photographs. Colours produced are sharp, vibrant and accurate, even in high ISO. The camera includes a low pass filter that clips false colours and oversharpening, which is a notable improvement over predecessors. The fairly neutral balance produces particularly exciting reds, and skin tones are well reproduced.

The on-chip analogue-digital conversion allows the camera to process lesser background noise and more prominent subject data. This particularly helps when you are shooting at dusk, or pointing at the light source. This, combined with high dynamic range and good noise processing, produces excellent shadow details, and actually allows for better colour and noise processing from RAW files.

The new autofocus mechanism has a higher vertical coverage, with 61 AF points, of which 41 are cross-type. The five central points are dual cross-type, with the centre sensitive to -3EV. This is particularly beneficial once you pair the camera with fast lenses. On an overall note, the EOS 5D Mark IV improves majorly on low-light focusing, and the overall focusing speed and precision is appreciable. The 150,000-pixel RGB+IR metering sensor enables superior

subject tracking in Live View Servo AF. You can also select focus and let the camera track it automatically, although continuous shooting for this mode is set to 4fps, slightly limiting its extensive professional usage. Focusing performance is certainly among the best in its class - with the Dual Pixel sensor further contributing to it.

The low noise floor allows for great ISO performance, and the 5D Mark IV allows for good ISO invariance. In low light, you can shoot with shutter speed and exposure set according to ISO 3200, and underexpose the ISO by 3 stops to shoot the photograph at ISO 400. Post-processing this keeps noise at bay, while retaining colour accuracy, shadow depths and overall sharpness. Disruptive noise in RAW processing only kicks in at 4 stops ISO underexposure, which is not unnatural. You get no banding at ISO 100 and accurate colours at ISO 3200, making it a very good performer.

The Canon EOS 5D Mark IV comes with IEEE 802.11b/g/n WiFi standards, along with built-in NFC and GPS. It operates on the 2.4GHz band to maximise compatibility with most present day smartphones, and uses its own hotspot to pair using the Canon CameraConnect app. The battery lasted for 500 stills and 45 minutes of 4K video shooting at 30fps, which is about average.

To sum up, the Canon EOS 5D Mark IV is one of the best full-frame DSLRs out there right now, and is also one of the easiest in terms of usage.
