

thing that I faintly remembered about Chromebooks - offline apps.

Offline Chromebooks - Not completely useless

After a quick dig at the Chrome Web Store and around some of my trusted sub-reddits, it was evident that Chromebooks had far better offline support when it came to apps now. There are over 200 apps on the Web Store that work offline! Trust me, if my surprise seems unwarranted to you compared to the Play Store, that's a dead giveaway that you haven't really used a Chromebook in its early days.

In fact, let us assume a situation in which there is no internet and no electricity (Yes, I just conjured up hell in front of your eyes!). Compared to a standard Windows laptop, A Chromebook would be more reliable for its owner, thanks to the offline support as well as the great battery life that most Chromebooks come with. That is, if you can survive without internet for 7-8 hours. And the moment you come back online, everything syncs back into place, including peace of your mind. Of course, I swear by internet connectivity - Wi-Fi at my place and hotspots wherever I go. Go ahead, call me internet obsessed but I'll be having the last laugh when the cloud takes over the world!

Jokes apart, on the other hand a connected Chromebook would do a lot of things for me. For starters, I don't need to store any media anyways -

Netflix takes care of my TV shows and movies, Google Play Music can handle my music collection and last time I checked, Google offers 100 GB of free Google Drive storage for two whole years if you purchase a Chromebook. All that and a device that doesn't even need to boot up each time you turn it on - just press the button and you're there, ready to log in and get productive.

A Chromebook for almost!

Next time we had a round of CS:GO, I made it a point to appreciate the guy's perfect choice about the Chromebook for his brother. I could tell that he almost audibly laughed at everyone else but stopped himself. Maybe it isn't really a good idea to laugh at a lobby full of people you're about to play a deathmatch with, eh?

So what followed were a series of questions directed at my statement and in general about my betrayal to the PC master race. That is, until I absolutely owned them in a few successive deathmatches while telling them about a Chromebook perfect for their use case. Yes, there is a Chromebook for almost everyone. Almost. To all the TV show addicts and movie fanatics, I suggest a full HD Chromebook in the likes of the Acer Chromebook 14 to use your Netflix subscription to its full potential. And if you're still looking for something to support all your offline content, first you need to come out of

the distant past, so that you can see that there are Chromebooks like the ASUS C301 which go up to 64 GB of onboard storage. There are plenty of good options in India that have 32 GB of storage as well.

In fact, you could have the added advantage of a flip 2-in-1 design with the ASUS Chromebook Flip. Chromebooks are essentially designed to be lightweight and portable which makes them a perfect entrant in to the 2-in-1 form factor category.

Most of them were convinced and reached the same conclusion that I had just a couple of weeks ago - Chromebooks are the perfect device for a popular group of users who, unlike me and you, don't really care about the heavy lifting. Who would've thought that a group of people, including me at an earlier point of time, would see Chromebooks in a new light due to a CS:GO match? Knowledge sometimes does come from the most unexpected of sources.

Of course, some of them were still unconvinced as Chromebooks had no Steam support and doesn't look like it's going to get it anytime soon. For them, I had no answer ... yet. 

P.S - Some Chromebooks already have Google Play support and some will be getting it soon. If you're planning to buy one, keep a tab on <https://www.chromium.org/chromium-os/chrome-os-systems-supporting-android-apps> to stay up to date with this feature.

Dolby for home

Dear Sir, I would like to buy a home theatre system for my house. I want a Dolby Atmos sound system. Essentially, when a horse is running on the TV, it should sound like the sound came from the back to the front and I should be able to feel it even with my eyes closed. If there's an activity on the left then only the left speaker should give the sound and the same can be said for the other side. Please recommend me a system and the accessories.

- Sangsaptak

 Hey Sangsaptak, we think you're confused between Dolby Surround and Dolby Atmos. Dolby Surround sound systems deliver sound in a single plane using five or seven speakers strategically placed around the room. Dolby Atmos adds another dimension by giving you spatial or 360-degree sound, where the sound is delivered from the ceiling of the room. The query you mentioned is for Dolby Surround and buying a 5.1 or 7.1 home

theatre system should be enough to take care of your needs. We would recommend the Samsung HT-J5100K/XL 5.1 Ch Home Theatre system and if you can stretch your budget, you could go for the Yamaha YHT-299 Home Theatre System.

Yamaha YHT-299
