

Volkswagen launches Moia

Moia will be a new standalone mobility company under VW that will specifically focus on mobility solutions. <http://dgit.in/VWmoia1>

The history of small pox

A new mummy discovered suggests that smallpox disease is just hundreds of years old, not millennia. <http://dgit.in/SmlPoxStdY>

If you're interested in Dolby Atmos for Home, you'll have to shell out more money since the entire system and the setting up process is expensive. It would be a good idea to future proof but do note that you won't find abundant content supporting Dolby Atmos. You will require Dolby Atmos enabled speakers which would fire the sound upwards, giving you the spatial feeling, while you can use regular speakers for the rest along with a Dolby Atmos enabled receiver. For the receiver, you could go either for the Pioneer VSX-930-K or the Denon 7.2 AVR X2200W.

Gaming keyboard

Yo digit, I'm a bit confused as I want to buy a good gaming keyboard for my PC. Please help me pick a keyboard. Following are the names of a few key-

Zebronic Max

boards. If you have any other keyboard in your mind, please let me know.

- Logitech K400 PLUS Wireless Gaming Keyboard (Black)
- MARVO KM 400 Scorpion Wired USB Gaming Keyboard (Black)
- Circle Armor Professional Gaming Keyboard
- Generic Waterproof 2.4G Gaming Wireless Keyboard and Mouse
- Circle Ballistic Professional Gaming Keyboard
- Redragon ASURA K501 USB Gaming Keyboard

My budget is ₹3k only. Hoping you will reply soon. Thanks in advance.

– Ayush

A Hey Ayush, under a budget of 3k, you can buy mechanical keyboards including the TVS Gold USB/PS2 and the Zebronic Max keyboard, selling at around ₹2k. The TVS keyboard uses

genuine Cherry MX Blue switches whereas the Max uses Outemu switches which are cheaper variants, but the advantage in the Max would be better build quality and backlit keys. Mechanical keyboards are a refreshing update from membrane keyboards and great for gaming and typing. If you're looking forward to membrane or hybrid keyboards, then you could go for the Cooler Master Devastator II which is a keyboard and mouse combo.

RAM for laptop

Hello Digit, my name is Akash (huge fan of your FastTracks and dmystify). I need a little help from your side. I want to buy an 8 GB DDR3L RAM for my laptop. I already have in-built 4 GB RAM but I'm not able to identify which RAM will work on my laptop. There are dozens of 8 GB DDR3L

RAM from different manufacturers.

Which one should I prefer? I'm very confused. I hope you can give me

proper guidance about this. I only need performance. My laptop's model number is Asus X550JX (i7-4720HQ 2.60 GHz, 4 GB RAM, 1 TB HDD, 4GB DDR3 NVIDIA GTX 950M Graphics). My laptop is mainly used for software such as Android Studio, Unity3d, Photoshop CC, etc., and I only play a single game – Cities: Skylines by Paradox Interactive. So, which RAM should I buy to meet all my minimum requirements. I know your team will give me the best suggestions so I'm really waiting for your reply.

– Akash

A Hey Akash, you could go for RAM modules from any top manufacturer since they don't have much of a difference in performance. And since you won't be gaming much, the regular base models should be enough. Hence, you should only consider your brand preference and price. Most of them are clocked at 1600 MHz, so you can pick any one from Transcend, Corsair, Kingston or ADATA.

Gaming mouse

Hi Digit, My Razer Death Adder 2013's left-click is registering double-clicks even when I click once. It's been almost two years since I bought the mouse, and it's been acting up for the last two weeks. Since the warranty period is already over, I was wondering whether

Razer DeathAdder Elite

the mouse can be repaired? Or will I have to buy a new mouse? If it can't be repaired, please suggest me a good gaming mouse at around ₹6k. Thank you very much.

P.S. It would be great if you could recommend me an RGB gaming mouse.

–Mohanvance.

A Hey Mohan, it's been a common complaint with the DA 2013 and it's nice that the mouse lasted you for so long. This is a switch problem and can be solved by replacing the switch itself. But you'll have to open up the mouse, desolder the faulty switch and solder the new ones. It would be better to avoid this if you don't have any experience with soldering. But if you're already considering about purchasing a new mouse, then give it a try and take the help of an experienced person.

For around ₹6k, you could go for the trustworthy Logitech G502 Proteus Spectrum. Or if you want to still continue with the Death Adder's familiarity and RGB lighting, go for the Death Adder Elite which has more durable switches than the previous generation. Coincidentally, we have done a mouse comparison this month, so make sure you check it out. It might help you in making a decision.
