

Foldscope

Foldscope is an origami microscope that can fit in your pockets. It's made mostly out of water-proof paper and allows you to make use of a microscope without the bulk and expense of a conventional microscope. Foldscope is aiming to bring the microscope out of the labs and into the hands of the people. Don't be fooled, Foldscope is a proper microscope and has the magnification and resolution to be able to image individual cells and other single celled organisms. Thanks to its price and design the Foldscope can be used anywhere, it's a great tool for one with a curious mind, effectively bringing science into your daily life. Foldscope comes with its own kit which fits nicely into a pencil box like package.

The kit comes with key items that allow you to prepare and mount samples in whatever kind of setting you're in at any given moment. This way you have all the tools you'll need if you need to quickly zoom in on something. The standard Foldscope comes with a 140X magnifications lens.

Price: \$20

EyeQue

EyeQue is a personal vision tracking smartphone vision test. Using EyeQue you can test your vision at home without having to go through the hassle of getting an appointment and having to travel to a specialist for tests. All you need is the EyeQue miniscope and the myEyeQue app which is free and available on both the Apple App Store and Google Play. When using EyeQue your results are returned almost immediately, and the record is returned using spherical, cylindrical and axis figures which are the same as those used by eye doctors to generate prescriptions. That means that you can determine what kind of glasses you'll be needing right at home and can simply place an order for them online or skip the appointment and head straight to the spectacle store. To add to that, you can check your vision history on the app as well, allowing you to compare and share your vision history with your doctor.
