

DESIRE

TAKE MY MONEY!

Here is where we keep an eye on crowd funded projects that will make you go 'Shut up and take my money!'

FlowMotion ONE

The FlowMotion ONE is a smartphone stabilizer which aims to provide smooth and cinematic videos with your smartphones. It's a gimbal for your smartphone. It comes with a slew of features which allows you to make videos like the pros. It eliminates camera shake entirely, it's compact and weighs only 300 grams. You can dismantle and fit it in your pockets with ease. You can mount the FlowMotion to pretty much any

camera mount or the optional carbon extension pole that comes with the device. The FlowMotion ONE comes with its own app that allows you to make use of its auto follow technology. All you need to do is mark the person you wish to follow and the ONE will keep them in the frame no matter where they are.

iKeybo

The iKeybo is a virtual laser projected keyboard, piano and portable charger, all in one. It's multi-lingual as well, so anyone can use the iKeybo. It can be a pain to type on a keyboard whose layout you aren't familiar with. To remedy that, the iKeybo comes with 4 different language layouts: English, Spanish, Arabic, and Chinese. Now while we're not particularly concerned with that, it's still pretty cool.

Another cool thing about the iKeybo is that it comes with its own in-built music app and can transform into a piano, guitar, bass or drums when you want it to. Simply hook up your smartphone onto the iKeybo and let the tunes flow.

The third perk of the iKeybo is that it doubles as a portable charger for your devices as well and can hold up to 10 hours of charge. And we all know how much extra power comes in handy!

And lastly, the device is compact enough for you to be able to carry it around with ease. So if you're in the market for a really cool looking keyboard cum instrument cum charger that's light weight and feature rich, all you need to do is look up the iKeybo on Kickstarter.

NexD1

The NexD1 is a 3D printer capable of high-end prototyping, multi-material and 3D electronics printing. It utilizes industrial-grade 3D printing technology called PolyJet which they've scaled down and are calling it DigiJet. DigiJet is capable of printing a wide range of materials from nanoparticles to special resins. The NexD1 can print fully functional circuits and can place them in any 3D configuration within your design. It uses a six cartridge system which allows it to combine and print up to six materials at once. It's eco-friendly as well, and operates with non-toxic water soluble support materials. You can also connect to the NexD1 through your smartphone and print from anywhere, it's comparatively easy to use than some of the other 3D printers out there, and significantly cheaper as well. If you are interested in some 3D printing, check them out on Kickstarter.
