We all love a good bargain, and we love the highs we get from some retail therapy. Digit readers especially love the feel of a new gadget in our hands... it's just pure bliss isn't it?

However, retail isn't just for buying gadgets... with demonetisation a lot of us are buying everything online or from larger stores, and using plastic to pay for it all. This is good because it

Then of course there's VR and AR that can be used to tell you what size of clothes you should buy, lets you try on (virtually of course) clothes that are available for purchase online, so that you know how it would look on you (or at least get a pretty good idea). And all of this is just technology that's akin to Snap-

Chat filters! Then of course VR can allow retailers to give you a large mall-sized experience without incurring any of the associated costs, because you will visit virtually from the comfort of your home.

With so many inventive ways being thought up about how to make your shopping a novel experience, we're pretty sure that 2017 will forever change the way we shop, both online as well as offline.

BOOM!

The Chinese also seem to be making progress and are working towards Mach 10 (10 times the speed of sound) missiles. The US is still far ahead, with rumours suggesting that they are on their way to achieving Mach 20 already. Lockheed was awarded a \$147 million

contract by the US to build a Mach 20 payload delivery system.

Why is this so important? Because most countries have defense systems capable of shooting down traditional ICBMs of the type, say, India, Pakistan, France and England have. In order to beat defense systems, there is only the option of stealth which is very hard in this day and age of sophisticated satellite surveillance, and of course, good old speed. If the missile is faster than the anti-missile, you win. At Mach 20, a payload would be impossible to stop and hard to even detect in time. Theoretically, the US could bomb and disable all nuclear

Amazon's advance shopping technology where you never have to wait in line.

will open up more people to accepting the newer way of buying things, which in turn will help people innovate in the space. With that in mind, 2017 seems to be the year things will change in retail in India... but this is also true for global retail, and some of the technologies used abroad will find their way to us, or inspire local versions, because, we are, after all, one of the biggest consumer markets in the world.

Augmented Reality actually plays a large part in online shopping, and we think you will see more and more of it starting in 2017. Most of you know that we have partnered with Blippar to augment our covers, and Blippar is also doing some good work with retail. Using Blippar you can buy products that you see models wearing on runway shows, you can preview how a piece of furniture would look in your house.

Using social media and updates from friends, and a little A.I. magic, you can get suggestions about what to buy friends for their birthdays, or for special occasions. IBM's Watson is being used in a project called Watson Trend to accomplish this.

17 WAR

Sadly, the one things we wish wouldn't improve is our efficiency at killing one another, but we know we will get better at it. Defense research is perhaps a total misnomer, because pretty much most of the R&D dollars spent by every country on earth goes towards offensive weapons... things meant to kill others, and not so much ways to "defend" against attacks.

The world spends a whopping \$1.6 trillion a year on defense, just because we can't all get along.

One of the biggest developments in nuclear warfare (something we hope is never used, but perfect, just in case), are hypersonic ICBMs. The US, China and Russia are said to be working on this, and although no one knows for sure, the US seems to be in the lead, given the nervousness of the Russians.

sites in Russia or China before they even knew what had hit them, let alone launch a retaliatory strike!

There are a lot of smaller enhancements being made to weapons as well, and lasers seem to be the choice of weapons for 2017 and beyond. Star Wars may finally be coming true, and wars of the future might just be fought with lasers!

Well that was our list of the 17 areas that will completely change due to tech advancements and progress in 2017. While it may not be exhaustive, it definitely is exciting. **d**
