Introduction to AR development tools

To get started with Augmented Reality development these are the tools you need to know about

Last month, Pokémon GO officially launched in... oh wait! Not again! Not another article about augmented reality starting with Pokémon GO! It almost seems as if Pokémon GO and augmented reality have become synonyms thanks to the events of last year. Thankfully, there's more happening which will change this perception, and fast.

We now have AR apps freely available on Android and iOS, and they perform beyond the expectations we had just a year ago. For example, the Google Translate app can detect text by using your smartphone camera, and translate it on the fly using augmented reality. You end up with the original text being replaced by software to look as if the book magically appeared in your lan-

guage. And this isn't even new, but it is an example of how AR can seamlessly integrate into our lives.

Vuforia

One of the most complete SDKs for the augmented reality platform, Vuforia is perhaps one of the most feature-rich AR development tools out there targeted at mobile devices. Like most AR tech, it uses computer vision to comprehend the scene in front of the device camera and identify surfaces. Once identified, the orientation and visualisation of virtual objects is kept in sync with the device orientation.

vuforia™

Vuforia is one of the most popular AR development SDKs

Some of the features it offers are:

- Object recognition
- Virtual buttons
- Open GL support
- Smart terrain – ability to reconstruct terrain in real time
- Extended tracking
- Cloud database for image recognition

While Vuforia has paid versions that offer certain advanced capabilities for AR development, the free version is still pretty powerful. The Vuforia platform supports Android and iOS smartphones and tablets as well as digital eyewear. Developers can build Vuforia apps in Android Studio, Xcode and the Unity cross-platform game engine. It's no surprise that Vuforia is the top choice for a lot of developers. There's a full list of developers and apps that use it at <https://www.vuforia.com/Apps> which you can check out. Apart from the free version, the SDK also comes at either a
