

New Vine camera

Vine recently announced that they're closing their service and rebranding the app to Vine Camera. <http://dgit.in/VineCam>

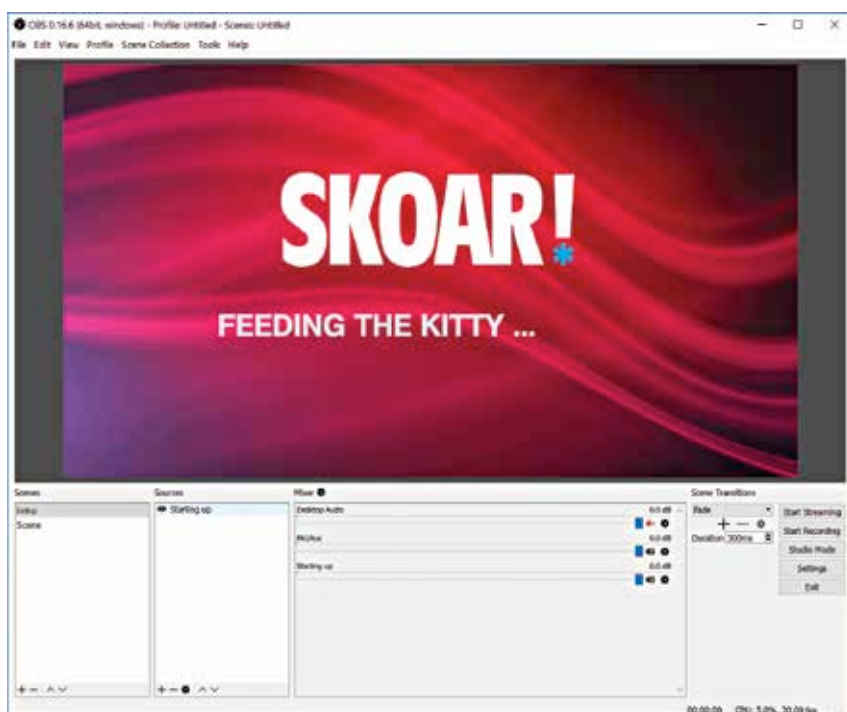

New airliner concept

This new airliner concept can help airlines easily rearrange and mix their sitting positions. <http://dgit.in/CrazyAir>

LIVE STREAMING

YOUR GAMEPLAY TO YOUTUBE

If you've always wanted to show off your AWP-ing skills in CS: GO to your friends, here's an extensive guide on how to livestream your gameplay to YouTube.

Abhijit Dey
abhijit@dgit.in

Over the years, YouTube has witnessed a rise of channels hosting their gameplay religiously, whether live or pre-recorded ones. In fact, the most subscribed YouTuber, PewDiePie, rose to fame with his Let's Play videos. Earlier, streamers relied on recorded footage

but now, it has become effortless to livestream your gameplay, accessible to everyone and not just to professionals. You'll find premium software bundled with gaming laptops or even games, that have far easier setup controls. But for this workshop, we will explore a free and open source alternative, and probably the most popular broadcasting service called Open Broadcast Software, or just OBS.

Before we begin, there are a few things you need to keep in mind. You'll obviously need a good gaming PC and a high-bandwidth internet connection for a seamless and good quality stream. But you don't need to worry if you have a poor internet connection because we were able to stream at lower bandwidths of around 1Mbps and on a system running a Second Gen Intel Sandy Bridge CPU. Although the stream might be strong but depending on your ISP, your game pings might get affected. In one of our test cases, the ISP was able to simultaneously maintain a stable ping and stream as well. The shortcoming with low bandwidth connections would be poor, pixelated streams, even though your stream could be running at 1080p and 60fps.

A better setup would also require you to have another display so that you could be playing on one display while controlling and watching your stream on the other. The best solution for a high quality and seamless streaming experience would be the use of a dedicated streaming PC, where you play the game on one PC while the streaming PC captures your game and streams it online. This workshop will only be looking at how to stream using a single PC.

Downloading OBS

Currently, there are two downloadable
