

Engineering Rice

Researchers are working on new ways to reduce the amount of phosphorous that plants waste. <http://dgit.in/EnggRice>

New UberPool timer

Uberpool now has a specific timer so you don't have to wait long for other carpool mates. <http://dgit.in/UbrpolTmr>

Workshop

versions of OBS – OBS Classic and Studio. Classic is the original software the project was started while Studio is the revamped version. The advantages of Studio is that the entire software has been rewritten from scratch and the Settings menu has also been overhauled to make things easier. Another advantage would be pre-installed plugins, because earlier, you had to install them individually in Classic.

Now, the question is whether you should download Classic or Studio and the answer is simple. New users should definitely download Studio since fiddling around with the different streaming and encoding settings is a tad bit easier than Classic. The main reason would be the discontinuation of updates from Classic whereas Studio has been witnessing a healthy update cycle.

You can download OBS Studio here: <http://dgit.in/OBSDwnld>

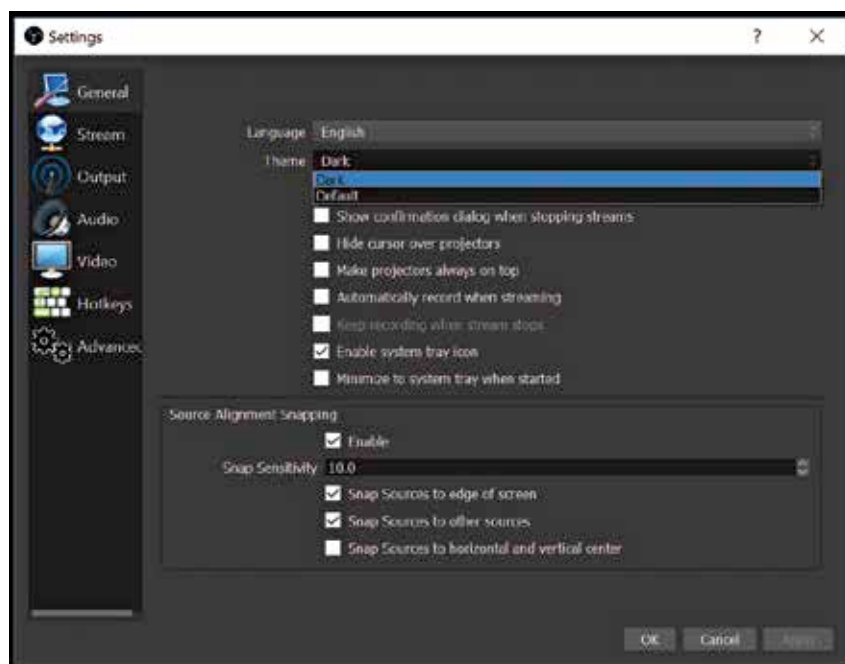

Setting up scenes and sources

When you start up OBS, you'll be presented with a blank window and four sections below it. In the Settings menu, the General tab includes a few useful features and also an option pick between a light and dark theme, a feature missing on Classic. A scene is a collection of elements from different sources that ultimately forms the final screen that is streamed to your viewers. Multiple scenes can be added to a single stream and switched accordingly using hotkeys in between the stream. It's smarter to assign a purpose to every scene rather than adding multiple scenes for every single source since there's no restriction on the number of sources in one single scene. This will make it less complicated to switch scenes when you're in the middle of a live stream. Sources are elements where your content will be pulled such as your desktop screen, webcam, mic audio, desktop audio, browser window, etc.

As a means of making your live stream look good, we would recommend using animated intros, borders and overlays for your sources. These aren't a necessity but your viewers will

love the customisation based on your channel's theme. The animated intro also acts as a buffer for the times when you're about to begin your live stream. Rather than showing your desktop, you could display the animated splash screen in loop.

Out of the three, Game Capture is what you should be opting for but there were times where a blank screen was output and the stream lagged during switching. If it doesn't work out for you, Display Capture should be your option, the only problem here could be your

The OBS Studio version offers an easy to use interface when it comes to tweaking

Create the first scene and name it something like Intro. Animated intros or any kind of video element can be added as a Media Source. If you want to save on bandwidth, and add just a standby image instead of a looping video, you can add one or more from Image or Image Slide Show. In the same way, you can also add text using the Text (GDI+) source. Along with an intro source, you can also add another image or media source as Standby for the times when you need to take a break but still continue streaming or make changes in OBS on the fly.

Moving on to adding your gameplay as a scene, we'll create a new scene and name it Game. Naming and assigning hotkeys is important at the beginning to prevent any confusion later after you've added multiple scenes and sources. To display your game, you have three options including Display Capture, Game Capture or Window Capture.

entire desktop screen will be visible to the viewers. But this can also be prevented by switching to your Standby screen or intro when you're using the desktop, and switching to the Desktop Capture after opening up the game using hotkeys which register globally over any running process. If you wish, you can also add your webcam feed as a source using Video Capture Device. You can then move, crop and resize the webcam feed wherever you want on the screen. To follow the channel's theme, you could add a border as an Image source around the webcam feed and also a logo somewhere in the scene.

There are many variations that you can try out by adding multiple sources to the same scene and finding the best composition you need. Once you're satisfied on the scenes, you can assign hotkeys to them under Settings to switch between them without opening up OBS. Avoid assigning hotkeys that
