NASA goes social

NASA announced two new accounts (Giphy and Pinterest) where they will share new GIFs from space. <http://dgit.in/NASAgifsnw>

UPI START MAKING PAYMENTS IN A FLASH!

If you have felt the effects of the cash crunch, read on to find out how you can use UPI to make payments

Abhishek Balaji
feedback@digit.in

Digital Payments in India took off more by force than by choice. If you're one of those affected by the sudden move to a digital economy, we bring you one such service which promises to revolutionise the payment space in India. Digital Payments or most commonly known as 'Plastic Currency' is a creation of twentieth century bankers who wanted better ways to handle their money. Currency is an integral part of any economy. These small chunks of metal or paper represent a real value in the world. The currency in an economy is heavily reliant on the prosperity of the country. So, a country can be more prosperous by printing and circulating more currency? No, just ask Greece. The amount of currency in circulation at any point of time is dictated by the amount of reserves of wealth the state-owned bank has. For example, in India, the Reserve Bank of India is the federal bank which regulates the printing and circulation

of currency in India. RBI gauges the volume of currency to be printed by the amount of gold reserves it has. That is the biggest hurdle digital payments face. For an economy to go completely cashless and digital, it needs to be regulated. Right now, the only solution is to virtualise the currency. Services like bitcoins have a different take on digital economies. Instead of just making the same currency virtual, bitcoins and other blockchain based

for allowing the use of the computation power in their personal computers. The computing power is used to repeatedly access and decode the various strings of data that arise out of a mathematical formula. The formula, along with the software used for mining the bitcoins, both are open source so there is more accountability with the currency.

While we're far off from a completely digital economy, India has announced recently a payment system known as UPI or Unified Payment Interface. UPI borrows a few tricks from bitcoins by eliminating the need to exchange personal information such as bank account details, names or phone

cryptocurrencies introduce a new type of digital asset. Bitcoins are decentralized, which means that they are not pegged against any form of resources or reserves. There is no central authority that controls the currency and hence, it might seem like a better option. Instead, it is a system to reward users

numbers when making any transaction. While normal online transactions are secure to a certain extent, the sheer volume of transactions means that your personal data is being transmitted across the internet so many times, that the risk of your data getting compromised increases dramatically.
