App for assault victims

A reporting system for sexual assault victims where they can speak up without disclosing personal information? <http://dgit.in/AssltApp>

can also choose from one of the many 3rd party apps that have sprung up. These apps support multiple banks and often have features more than the native bank applications. The apps must be certified by the NPCI, although given the initial push, the certification process isn't too stringent.

You can start by finding the bank you use and one that has already implemented UPI and download the respective app. Although almost all banks have an app for UPI, you might find them clunky or unusable. You can, however, use any bank's

Step 2 : Activating PhonePe UPI Account

After creating the account, you'll be prompted to create a Virtual Payment Address or VPA, which is what you'd be sharing with everyone for receiving digital payments.

Creating a Virtual Payment Address is like getting an email ID so you know the drill. The VPA must be in a set format:

username@bank_code

For example, if you have an account in ICICI Bank (Pockets), you can create a VPA as john@pockets. You can also use your mobile number as the username. The

VPA is linked to the bank account, making it possible to link multiple bank accounts to the same mobile number and have a unique VPA for each bank account. After you create the VPA, you'll have to link your bank account to this VPA. Till now, only your mobile number has been linked to the VPA.

You'll have the option to link any supporting bank account to the VPA by just verifying your mobile number.

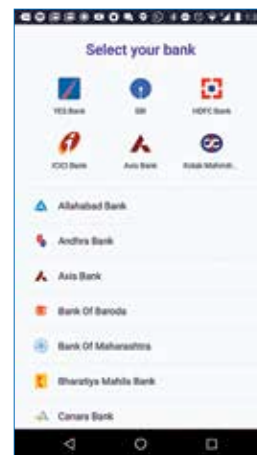

The app sends a request to the bank trying to match the phone number

provided to the respective accounts. Once this is authenticated, your bank account would be linked to the VPA. That's it! You're now registered to make transactions over UPI. Easy, right?

How do you transact?

To send or receive payments, you'll need the other person's VPA. You can then add them as a contact with the VPA and start transacting. UPI does away with OTPs, so there are no hassles when initiating transactions. Payments can also be requested from the app.

This is useful for merchants who can request a payment from a customer. When a payment is requested, the customer is notified and when they approve, the money is transferred instantly. There will be service charges for most transactions unlike existing wallets.

Step 3 : Link Bank Acc.

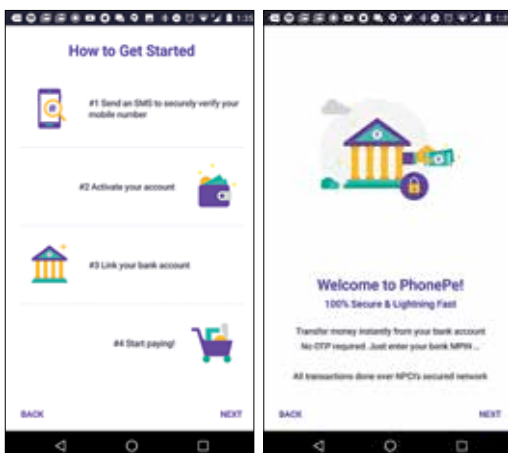

Additional Services

Apart from sending and receiving money, the UPI allow several functions. You'll be able to Recharge your mobile, data card, DTH, broadband and pay you electricity bill and even pay insurance premiums.

It doesn't make sense to use UPI for small amounts as the service charge would be a significant chunk of the

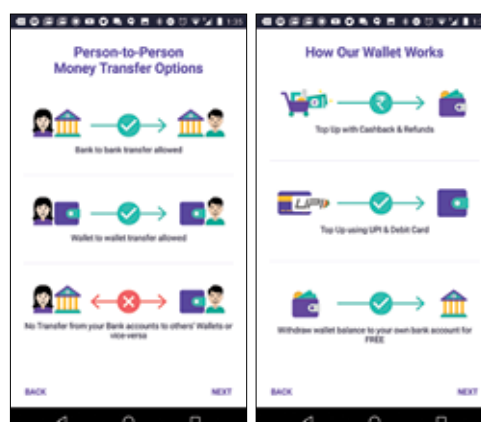

amount transacted. Most of the UPI apps we tested also has a feature to split the bill among friends. You can take advantage of this in situations where a group of people might share a restaurant bill and each person can pay their share by using UPI. And since it directly withdraws from your bank account, you don't have to go through the hassle of topping up another digital wallet.

Step 1 : Setting up PhonePe

app for registering and making transactions through UPI. We found that only a couple of apps worked reliably, we used PhonePe which is a third-party app. Once you download the app, you'll need to verify and link your phone number with the app. This can be done by sending an SMS automatically. After your number is verified, you'll be able to create an account with PhonePe, linking your phone number. After providing the details requested such as your full name and email address, you need to create a MPIN, which is what you'll be using the log into the app and authenticate some transactions as well.
