

ANDROID EVERYWHERE

Google's Android is free and open source, app

development is easy and it also works on almost everything. No wonder it's the most popular OS. If anything you build has a screen on it, there are plenty of reasons why Android should be the OS you work with and you can find them here.

SIMPLE AQUARIUM PHYSICS

You can have a pretty cool looking vacuum

suspended aquarium using a glass jar or vessel to create a tank above the water level. This simple DIY project explains how this is possible using simple physics and looks totally cool.

THE DEATH STAR'S FLAWS

In Star Wars, the "Death Star" may be represent as a

symbol of fear and oppression, but to an architect, it's just poor defence, limited amenities and an overall bad design. Here's what a couple of engineers and architects had to say about the planet-killer's vague design:

EXPLAINED: OLED TECHNOLOGY

Organic Light-Emitting Diode (OLED) displays

are bright, crisp and incredibly more beautiful. But the technology is still very new and they are still very expensive. But are they worth the extra cost? What about the content? Is it worth it?

Technology that died in 2016

2016 was a year full of farewells in the tech world, so here's a recap of all things tech that will not see the light of day in 2017.

– By Souvik Das

Every year the tech industry bombards us with a barrage of new products and fascinating technologies to pave the way for our digital future. At the same time, with each advancement in technology, with each new phone, with each new app or software, the old goes out the window making way for more sophisticated gadgets and groundbreaking innovation. 2016 was a year full of farewells in the tech world, so here's a recap of all things tech that will not see the light of day in 2017.

Samsung Galaxy Note 7

The Samsung Galaxy Note 7 has already claimed top spots in our Most disappointing phones of 2016 and Biggest Tech stories of 2016 lists. Making an appearance for the third time around, the Galaxy Note 7 bags the most 'note'worthy tech death of the year. How not to rush a smartphone launch is a lesson Samsung has learnt only too well. As the phone kept bursting into flames, so did Sam-

sung's hopes of crushing Apple's flagship iPhone 7. Although, Samsung has promised to get to the bottom of the disaster.

Apple iPhone 5s, 6 and 6 Plus

You can probably still buy them from third-party sellers, but the iPhone 5s, 6 and 6 Plus have been officially discontinued. Following the launch of the iPhone 7, the 5s, 6 and 6 Plus were unlisted from Apple's website. With the 3 iPhones, Apple also said goodbye to the 16GB base variant and instead upped it to a minimum of 32GB storage for all variants except the SE.

Microsoft Lumia

Microsoft was bound to kill the Lumia brand after the devices took a major beating from competing brands. The Chinese invasion in the mobile market didn't help either. Nevertheless, the world is a better place without Lumia smartphones and Microsoft seems to have made a sensible decision.

Nexus

With the launch of the Google Pixel and Pixel XL, we finally bid farewell to the Nexus brand. The Mountain View tech giant apparently has "no plans" to continue the Nexus project which began back in 2010, using the Pixel name going forward.

Pebble

Disappointing many fans of its retro smartwatches, Pebble is now officially dead. Well almost. The hugely successful Kickstarter startup, Pebble recently sold

all of its software assets to wearable maker Fitbit. Fitbit is only acquiring key personnel and software assets from Pebble. The acquisition excludes Pebble's hardware products. So yes, it's time to say adios to the Pebble Watch.

Microsoft Band 2

The Lumia smartphone range was not the only money drainer Microsoft had under its belt. The Redmond based software giant was also not doing too well in its fitness tracker business. The Band 2 was abruptly taken off the Microsoft store this year, even though its listing page still exists. Microsoft also removed the software developer kit for the Band 2, indicating that it does not want more apps to be developed for the same.
