VERDICT

Best performer Steelseries Rival 300

The comparison included several accurate sensors including the PMW3360, PMW3366, PMW3310 and PMW3310H. It would have been unfair to select the best just based on the accuracy of the sensor, while putting less importance on the collective performance over different surfaces. This challenge was overcome by Enotus' mouse test. Throughout the testing, we observed in real world tests how the surface could

drastically affect the mouse's performance with something as minor as a colour patch on the mouse pad. The Rival 300 consistently performed well in terms of precision on rapid movements and performance on different surfaces.

We reported CPI level discrepancies on almost every mice but out of the box, the 300 had an accurate value of 800 set at the default level. Although the Zowie FK2 won in the MouseTester sensor accuracy and stability test, the Rival 300 having secured second place in the same test, and first in the Enotus mouse test, bagged the first place title in overall performance.

Value for money ASUS Cerberus

It wasn't a surprise for the Cerberus to win the value for

money award. We've already mentioned that it's an entry level gaming mouse. Looking at the score sheet, MasterMouse Lite S falls short by a whisker because of the company's choice to go for a rubberised coating and textured grips, making it more comfortable to use. It also sports a gaming look which would certainly look good sitting on your desk. But the inaccuracy and malfunction anomaly that we observed during our MouseTester test runs at moderately high speeds, had us sceptical about
