EPSON L655 Ink Tank System Printer

Superb raster prints for the average SOHO

Price
₹24,999

The most prominent upgrades to the EPSON L655 over the L455, which is the last EPSON printer that we'd gotten our hands on, are the additions of an Automatic Document Feeder, and automatic double sided

printing thanks to the ADF. The nozzle configuration has also changed for the better with a more densely packed arrangement. EPSON has replaced the SD Card slot with Ethernet.

As for the printing performance, the denser nozzle arrangement sure does a much better job as it produces really accurate prints. Moire patterns are hardly seen, we had to really squint to notice some within the innermost circles of the standard Siemens-star. Even fine raster lines were accurately reproduced. Photo prints weren't as impressive as we could easily notice grainy texture over human skin, however, when we tried printing high-poly count CMYK colour wheels, we couldn't notice banding at all. Quite impressive!

The EPSON L655 does charge quite the premium, but the total cost of ownership is way better than cartridge based inkjets in the same price segment.

VOID Wireless Dolby 7.1 RGB

Great immersion and comfort; build quality could have been better

The 7.1 Dolby surround sound works through software, not independent

drivers, as there's only one 50 mm driver in each earcup. The headset provides a huge soundstage for games and we were able to distinguish the sounds from the left, right, front and back. Long pressing the dial on the left earcup disables surround sound. The audio quality is immersive for FPS and open world games. It's also great for watching movies but not for music. The quality of the mic is only good enough for in-game chat and TeamSpeak. The microphone was found to have a hollow and muffled sound signature. The headrest and

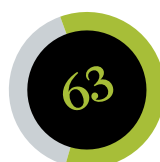

Price
₹14,999

earcups use memory foam for comfort and the foam is covered with a meshed fabric for ventilation. They might look heavy due to the size but the headset is light, and you can wear it for long gaming sessions. But we received an older unit and the swivel joints had become really loose. Even the headband clamping pressure was weak, and sudden jerks would displace the headset and the mic's stem.

RGB lighting is present in two zones on each earcup and we observed that keeping them switched off using the CUE software extends the battery charge immensely. The reasons to buy the VOID RGB are if you wish to own a wireless headset with great audio immersion, RGB lighting to match your rig and lastly, if you're a Corsair fan, to colour coordinate your for maximum RGB madness. If not the RGB, then the stereo and regular black versions of the headset are available at lower prices.
