GIGABYTE Radeon RX 480 G1 GAMING 8G

Why go for stock when you've got this?

Price
₹23,500
(+ Taxes)

You can easily notice how GIGABYTE has put some work into the design and built quality of this card the moment you hold it. And they've maintained the aesthetics to be in line with the look of their G1 Gaming series. The added RGB LEDs, power indicator LEDs and protective backplate give the card a premium feel. The backplate

is ideal if you have a liquid cooler for the CPU as accidental leaks won't wreck your graphics card. However, this does mean that the components underneath the backplate will be starved for air. The GPU, especially, tends to get a little toasty but with two 90 mm fans, this GIGABYTE unit is able to ward off high temps for a little longer than stock cards.

However, with the move to 14 nm FinFET, that's mostly taken care of. Performance wise, the few extra MHz on the core clock do give you an inch of extra performance over the stock RX 480. Which makes this card quite good for 1440p and 1080p gaming. We were able to push the card to about 1350 MHz but with the temperatures hitting the early 90s we decided to scale back. Overall, the GIGABYTE Radeon RX 480 G1 GAMING 8G is a pretty great upgrade to the stock card, so there's no reason why you shouldn't opt for one when upgrading to the new AMD Polaris GPU.

WD My Passport 4 TB

Colour coded storage

External hard drives or mechanical hard drives, in general, have reached a

point where you can't really differentiate between two models based on their performance. Although, these hard drives tend to differentiate between each other by offering more in terms of features such as cloud storage and automated backups aside from the overall design. With this particular offering from WD, the biggest change comes in the form of the new square-ish design and a bevy of colour options. While the design is somewhat subjective to what one may like, we personally would have preferred a sleeker more rounded design. But having the option to pick from six different colours, sort of makes up for that.

Price
₹17,140

On the inside, it is using the same tried and tested 5400 RPM 2.5-inch hard drive which we have seen in its previous generations. After taking into account file system parameters, the user gets about 3.63 TB of usable space. This means you pay around ₹4.6 per GB, which is not very economical as external drives with similar storage capacities are available at almost half the cost. However, during our testing we observed better data transfer rates compared to its counterparts. We saw peak sequential read speeds of around 246 MBps and write speeds of around 107.6 MBps. Random data from real world tests painted a similar picture with the data copy speeds averaging around 110 MBps.

On the software front, this WD My Passport comes with its application suite, including an automatic backup software, password protection and drive health check utility. Nothing we haven't seen before.
