

It is part of the Microsoft Accelerator program, which means they have a bright future. Besides, it's a heart-warming (CPU-warming?) story about robots and humans working hand-in-hand? We're going to need a few of those to convince the superintelligence that we're useful!

06 STEP SIZE Stepsize Layer is a desktop application that automatically adds context to code by using its tools to develop software and attach historical data to a piece of code. Using this AI tool, Developers can select a piece of code, run it through Step Size,

contact the original author and find the context. This will ultimately lead to a community of coders where all code is properly contextualized and connected to all other pieces of code. Step Size is fully integrated with Slack so that it can use it to do its job.

07 GALAXY.AI "When symptoms appear, it is already too late." Galaxy.ai uses its own proprietary software to aid the world to become a better place to live in. It collects data from traditionally difficult areas such as the sectors of medical care and insurance to help doctors worldwide make better

choices. They are building the world's first ever AI prognosis engine that will help doctors treat patients better. It also helps provide better, more-affordable insurance by studying the data provided by insurance companies.

08 BENEVOLENTAI Every 30 seconds, a scientific paper is published. Over 10,000 a day are added to just the medical portion of research. Because of this ungodly number, the amount of research that becomes 'usable' is only a small portion of this. BenevolentAI wants to solve just this by developing a tool that

combs through all this data to provide researchers and scientists with up-to-date information. This leads to a much faster rate of drug discovery, which in turn leads to a better healthcare system for all. Learn more about them here: <http://dgit.in/BenevolentAI>

09 NIKI.AI This Indian firm was founded in 2015 by 4 IIT Kharagpur graduates and is a chatbot that allows for a simpler customer experience. Its core functionalities include mobile recharge, travel services, and all bill payments. Ratan Tata recently gave this startup a hefty

amount of seed money, so they must be doing something remarkable. While this doesn't sound unique, their natural language processing power is aimed specifically at how Indians talk and type. It has partnered up with Ola, Uber, as well as PayTM to provide their facilities through their app. Currently, it provides services to around a hundred thousand customers. Learn more about them here: <http://dgit.in/NikiAIApp>

10 CLARIFAI You know how Facebook either asks you to, or automatically tags people in your pictures? Remember how often it's wrong? Clarifai is hoping to have a foolproof solution for that. It claims that it can teach its AI to identify an object with less than 10 input images, without additional code to help it. It also keeps collecting data, and learns as it goes. Here's a video you should watch about this: <http://dgit.in/ClarifaiCass>

What we've presented here is merely the tip of the iceberg. There are probably hundreds more who we haven't even heard of yet, but may potentially hold the key to finally

clarifai

achieving general AI – an artificial super intelligence that is as intelligent as a human (or more). Whether we like it or not, 2017 is the year when thousands of companies will work on AI more seriously than ever before. Humans don't come much smarter than Stephen Hawking, and he's already stated, "The development of full artificial intelligence could spell the end of the human race." (<http://dgit.in/StephHawkDoom>). Of course, Hawking is only human, and fallible, so we can only hope he is wrong this time, because none of the companies we've listed here or thousands more that we haven't are paying any attention to his warning... Should they be? What's your take? Write in and tell us before these bots take over our jobs!
