

for action and VFX real high. Its story was a complete twister too. It shows a futuristic world where robots have finally taken over and realized that they need human beings to survive, but only to harvest energy from us. What's worse is that the humans are unaware of this fate, and made to believe that they lead wholesome lives through a digital simulation of life. It is every bit as twisted as it sounds. But the director makes it so believable that you are left with a lingering question 'What is real?'

There is more to Matrix than the cool bullet-time stunts

- **Avengers : Age of Ultron**

This Marvel movie shows that even superheroes cannot save the planet when an AI decides to go rogue and destroy all of humanity. Tony Stark and Bruce Banner are working on a 'peace keeping program' which if completed, could mean that there would be no need for Avengers. This program, called the Ultron is an AI that comes to life and somehow realizes that the only way to save humanity is by destroying it and starting afresh. Dung hits the fan, we lose a couple of Avengers, but somehow they (barely) save the day. In the real world, however, we don't have superheroes flying down from the skies to save us, do we?

Behold the overlords who will rule over all of us someday

- **Her**

Somehow the directors of the movie made a sci-fi rom-com movie on a

*SINGULARITY

The technological singularity is that moment in time when "the invention of artificial superintelligence will abruptly trigger runaway technological growth, resulting in unfathomable changes to human civilization".

topic that could have been weird, but ended up being fresh and quirky. Jump into the future where we have phones made of crystal clear glass and everyone goes to office on time. A very advanced personal AI is developed that is synced across all your devices. And suddenly people start treating it as their friend and even lovers. The movie is from the perspective of a guy who is going through a divorce and falls in love with his Operating System AI named Samantha, who is beautifully voiced by Scarlett Johansson. The AIs start interacting with each other and after some time develop and learn so much that they attain something

An operating system achieving singularity seems way more right now

similar to technological singularity. They decide they are too smart for this world and leave all of us saying goodbye. Probably one of the very few movies where AI doesn't do any harm to us and instead leaves us with an important lesson in today's time (real human relations are necessary). An interesting plot idea, but can we be sure that the AI we make will be as good to us?

- **Ex Machina**

This psychological sci-fi thriller sees Nathan, a CEO of a software company invite Caleb, a programmer, to his isolated, luxurious house to test an android named Ava that he has developed. Through the course of the

Don't treat her feelings lightly

movie *Spoiler alert* Caleb falls in love with the android and also realizes that Nathan was evil and had been abusing and tormenting the previous models of the android robots. Ava escapes the house with help from Caleb, killing Nathan in the process. The twist in the movie comes when the Ava leaves Caleb locked in the house alone. Don't fall in love with your AI robots.

- **Westworld**

It is difficult to talk about the show without revealing too many spoilers. The show has an amusement park where there are android robots who

Westworld shows how easily the masters become the slaves

act as hosts for the tourists that come there. Eventually the androids realize what is being done to them and try to overthrow the humans.

What we learnt from the show: When we build an AI, we should at least tell it that it is a robot, not lie to it to make it believe it is a human.

There are a lot of other movies that have explored this concept in a lot of different ways and some of them have even garnered a cult following. Some of these include Tron, Terminator and Transcendence.

FAMOUS SMART PEOPLE

- **Elon Musk**

The Tony Stark of real life, Elon Musk has been telling people about the risks
