

Musk has gone as far as equating AI with demons

of trusting AI too much for quite some time. During an MIT symposium, he went on to say, “With artificial intelligence we are summoning the demon”. “In all those stories where there’s the guy with the pentagram and the holy water, it’s like yeah he’s sure he can control the demon. Didn’t work out”. He called for researchers and companies working on AI to come together to form an international regulatory framework so as to keep a check on the advances in the field and make sure that we don’t unleash the ‘demon’ upon ourselves. He had also tweeted “Worth reading Superintelligence by Bostrom. We need to be super careful with AI. Potentially more dangerous than nukes.” Well, that is one hell of a warning.

• Stephen Hawking

Stephen Hawking is one of the most respected physicists and cosmologists in the world. And when he warns you about AI going rogue, you shut up and listen to him!

When Stephen Hawking warns you – you shut up and listen

In an interview to BBC, he said “The development of full artificial intelligence could spell the end of the human race. It would take off on its own and re-design itself at an ever increasing rate. Humans, who are limited by slow biological evolution, couldn’t compete, and would be superseded”. Definitely sounds scary, doesn’t it?

After the release of the sci-fi Movie Transcendence, he went on to criticize AI researchers in a newspaper column saying “If a superior alien civilisation sent us a message saying, ‘We’ll arrive in a few decades,’ would we just reply, ‘OK, call us when you get here—we’ll leave the lights on’? Probably not—but this is more or less what is happening with AI.”

• Nick Bostrom

A famous Swedish Philosopher who is a Director at University of Oxford and has spent a large amount of time theorizing and thinking about what will happen when technological singularity is attained. Many famous technologists have also quoted him before. He said that once AI surpasses the human brain, they would kill us easily in different ways, leaving Earth like a “Disneyland without children”. Shudder.

Nick Bostrom has painted a grim picture of AI surpassing human intelligence

• Isaac Asimov:

One of the most famous sci-fi writers

One of the most prominent sci-fi authors of all time, Isaac Asimov predicted that robots could turn against us and came up with the 3 basic laws of robotics.

of all time, he wrote the famous novel ‘I, Robot’ that was later turned into movie. He came up with the 3 basic laws of robotics which have been widely accepted by AI researchers and scientists. The first and most important law is “A robot may not injure a human being or, through inaction, allow a human being to come to harm.”

• James Barrat:

Author of the book “Our Final Invention: Artificial Intelligence and the End of the Human Era” (the name screams doom and gloom), James Barrat interviewed a number of AI researchers and philosophers and documented it. He goes on to state that “Without meticulous, countervailing instructions, a self-aware, self-improving, goal-seeking system will go to lengths we’d deem ridiculous to fulfil its goals.”

• Gary Marcus:

Ex-head of AI at Uber, Gary Marcus wrote in a column in the New Yorker “Once computers can effectively reprogram themselves, and successively improve themselves, leading to a so-called “technological singularity” or “intelligence explosion,” the risks of machines outwitting humans in battles for resources and self-preservation cannot simply be dismissed.”

All these views and depictions, while based on fiction and conjecture, are based in the current state of science and technology - making it a very real future we might be looking at. When it comes, will you welcome it or fight?
