

You don't need to be connected to the internet to use this feature. Creators Update is scheduled for April and starting then you'll be able to install Windows 10 using voice commands. We have tested it on the insider preview of the Creators Update and it works just as expected.

tana, go to your Windows 10 PC and ask Cortana "Find my phone". It will automatically find it for you on the map.

Use Siri on Mac to quickly search files

As Siri is now a part of Mac you can use it to quickly search files for you. Instead of going through the Finder to get your file, just ask Siri "show the file that I was working on yesterday" and it will quickly show you all the files that you have modified the last day. This is a neat feature and an advanced search query that will save a lot of time looking for the file. It even works if you ask Siri to find files that you were working last week or even last month.

FLOATING APPS ON ANDROID

Most of you should be pretty familiar with Facebook's Messenger App. Although, there are a couple of concerns for some users like random crashing, delayed notifications, certain bugs, etc, one cannot deny the usefulness of the 'chat-head' bubble feature in Messenger. Basically, your chats appear as a pop-up bubble that floats on top of other application so you can easily keep your conversation going without having to minimize or switch between apps. This feature makes chatting much faster and sending/receiving messages becomes easier than on a browser.

Similarly, there are plenty of 'Floating' apps on the Play Store that offers similar kind of functionality. Say you want to take some notes while watching a tutorial video on YouTube, trying to complete a game but can't ignore a special someone's chat, calculating some scores

Create multiple windows with all running different application at the same time using Tiny Apps.

from an online spreadsheet, etc. There are many instances where floating apps can be very useful for multitasking or increasing workflow and here is a quick guide how to use a few of them.

Float any messaging app on your phone

Using Flychat, you can create chat bubble-heads (similar to Facebook's Messenger) for different messaging applications. To get started with Flychat, simply download the application from the Play Store, open the application and it will automatically detect all the messaging apps that are installed on your phone. On the application, you can select for whichever messengers you want the chat heads, and you can even put in different themes, change the chat color, set notifications or even block particular contacts.

Flychat currently works for messengers like WhatsApp, Telegram, Hangouts, Line, Allo, Slack, Twitter, Skype, Facebook, and many more. However, note that the Application isn't perfect and

it might not work flawlessly for every messenger. In our testing, we noticed that it didn't display videos on WhatsApp and also it didn't always create chat heads for Hangouts. Another issue we noticed was that it wouldn't create separate chat heads for a single app. For example, if you would have more than two different conversations going on in WhatsApp, you cannot have multiple chat heads for each conversation. All your conversations are laid out in different columns but the transition between them isn't as fluid.

Float your notes

As the name suggests, Sticky Notes is a simple hassle free app that can be used to take notes and save them. Similar to the Windows Sticky Notes, your notes can be easily resized, minimized or dragged anywhere on the screen. You can even share your notes directly to other applications and the best feature is the ability to take notes instantly on top of other applications be it any games, whether you might be watching a video on

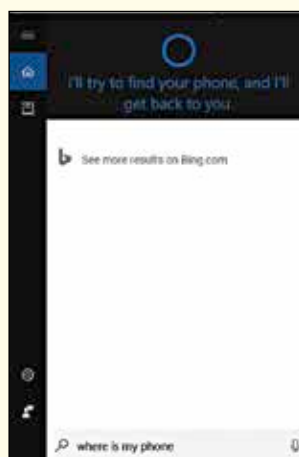

Can you play a YouTube video and browse the web while taking notes at the same time on your phone?

Make Siri talk to you like LEGO Batman

Siri just learned a new trick. It will talk to you as if you're LEGO Batman if you say "Hey computer".

Find your phone using Cortana

Microsoft has released Cortana for Android and iOS. If you are bored with Google Now or Siri you might like to try Cortana for a change. However, apart from this, if you are a Windows 10 and Android user, you can ask Cortana to find your phone from your Windows 10 PC. To do this, download and install Cortana from Play Store, login with the same Microsoft account you use on your Windows 10 machine. Once you have set up Cor-

Say "Hey Cortana" and ask for "where is my phone" it will locate it and notify its location on your desktop
