Q&A

Bad GPUs, bad displays and more bad GPUs

GPUs are failing our readers, as we come across several of them. April is all about displays and graphics cards, well mostly.

Q Farewell, old friend

Dear sir/madam,
I have a problem in my PC graphics card which I had bought nine years ago. It was working fine until November. Whenever I connect it to my PC's AGP slot, my PC doesn't turn on. After removing it and then connecting the monitor to the motherboard, my PC turns on. I'm not able to deduce the issue with my graphics card. Secondly, I called NVIDIA's service center in my city Lucknow, "Rashi Peripherals Pvt. Ltd", but they are not receiving the calls. Currently, they have also shifted their office to another place. Help me in resolving my problem.

– Swapnil Bansal

AGP video cards are a relic now

A Hey Swapnil, looks like your GPU has finally met its end life. Since you have already determined that connecting the monitor to the motherboard's display port does work, it's clear that the GPU has stopped working. There are chances that only the port might have conked off but considering your GPU's nine year old life, it's more likely that the entire component has died. Your warranty is obviously over and repairing it won't be a good and worthy decision. Instead, you should simply go ahead and buy a new GPU. Do note, since

your motherboard has an AGP port, you won't be able to insert the newer PCI-e graphics cards. So, you'll need a new motherboard as well if a GPU is necessary. Otherwise, you can continue using your PC using your motherboard's display port.

Q Android on Lumia

I have a Lumia 525 and I was wondering if there is a way to install Android on it. Most of the awesome games and apps are only available on Android (including your emag app). So, it would be awesome if you guys can help me out. Thanks in advance.

– Pajas Singh

Not many developers are interested in porting Android to Windows

A Hey Pajas, an XDA user had successfully installed Android Marshmallow on the Lumia 525, that could also be run on a Lumia 520 (forum thread: <http://digit.in/AndrdML525>). The development didn't see much light and has been discontinued for now. The build wasn't stable enough for everyday use. We also came across guides to install Android 7.1 but source files are missing and those files haven't been updated. It seems like not many developers are interested in this particular device to port Android. If

you wish to enjoy Android apps to yourself, we would recommend you to use emulators such as ARC Welder for Chrome, BlueStacks or for the best experience, buy a budget Android device for yourself.

Q The hottest games

I have a Dell Inspiron One 24 5459. I have played games such as Deus Ex Human Revolution, Grand Theft Auto Episodes From Liberty City, and Sniper Elite V2 and they play very well. However, certain games have a tendency to crash after 20 minutes of gameplay such as Sleeping Dogs, Max Payne 3, and Far Cry 3 Blood Dragon. I have installed the latest updates and drivers, disabled the touch screen keyboard, and even tried playing on low settings yet the games still crash after 20 minutes. I have the following specs:

- OS: Windows 10 Home Single Language 64-bit
- CPU: Intel Core i5 @ 2.20GHz
- RAM: 8GB Dual-Channel DDR3 @ 797MHz (11-11-11-28)
- Motherboard: Dell Inc. 0WCWFJ (U3E1)
- Graphics: Intel HD Graphics 530 (Dell) & 4GB NVIDIA GeForce 930M
- Storage: 931GB TOSHIBA MQ01ABD100 (SATA)

– Andy Kumar

A Hi Andy. Games crashing after 20 minutes sounds something like an overheating issue on your GPU. If the PC itself shuts down, then the CPU is overheating as well. Next time, try to run a software monitor tool such as GPU-z or Speccy to keep an eye on your GPU temperatures. Games that
