

Periscope Producer API

Twitter announces API that'll allow cameras and other hardware to share live videos directly. <http://dgit.in/ProducerAPI>

New iOS app Clips

Clips is a new video-sharing app made by Apple that doesn't have a social media network attached. <http://dgit.in/ClipsiOS>

Frequently cleaning up your laptop is a good idea

require a lot of rendering will task the GPU with load even though on low settings, and after a while overheat it. You should probably get your PC cleaned since dust accumulation can also overheat components. If you have experience, you can do it yourself otherwise we would suggest you to consult someone who tinkers around with PC components. If the overheating still remains, contact customer support. There might be something specific wrong with your device, in which case customer support should have a better idea on how to guide you regarding this.

Not on display

Dear Team Digit, I am a great fan of yours and really appreciate the work done by you guys to update us on latest technology. Currently my Dell Inspiron 15R N5010 laptop is not booting up. When I switch it on, there is no display on the screen. The processing indicator LED (middle of the three LED indicators) glows for 3-5 seconds then goes off. Initially, I thought the problem is with the power adapter (battery is not working since the past 4-5 months). I performed all the checks related to power as recommended by Dell but in vain. Power LED is glowing (blinking, amber colour due to battery malfunctioning), internal fan is also working.

I've also performed a screen display check by connecting the laptop to my TV with an HDMI cable but there was no display on the TV. I also tried to remove and re-insert the RAM modules, but that also did not produce any result. Is there a way this issue

can be resolved with your help? I took my laptop to a Dell Authorized Service Centre in Ahmedabad and they think the issue is with the motherboard. A new motherboard costs around 15K. I brought back the laptop and mailing you the issue with a hope. Please help me in whatever way you can. If you know any reliable local laptop repair shop in Ahmedabad, please do let me know.

Following is the laptop's system configuration:

- Model Dell Inspiron N5010
- BIOS Version: A12
- BIOS Date: 1/25/2011
- OS: Microsoft Windows 7 Home Basic
- CPU: Intel(R) Core(TM) i5 CPU M 480 @ 2.67GHz
- RAM: 4GB (2 x 2GB) DDR3, 1333MHz
- HDD: 500GB 5400RPM
- BATTERY, PRIMARY, 48WHR, 6C, LITHIUM ION,

– Ankur Jain

A Hey Ankur, you've managed to troubleshoot the entire problem by following the steps you have mentioned. If the screen isn't lighting up at all, it directs towards a damaged display. This could be because of a bad connection between the screen and the motherboard. Since the power LED is glowing, it doesn't seem like you have a booting issue. We always recommend our readers to completely geek out with electronics but under supervision with an enthusiast or expert to prevent huge losses. It could be worth your time trying to open up the laptop and determine whether the display is connected properly. To completely figure out the problem you should connect another laptop screen and check whether it lights up. This will help you eliminate almost all the possibilities. If all else, fails then you will have to get it repaired at an official Dell service center to ensure genuine parts for your laptop. Even though that might seem to take more time than you would prefer, that would be the safest and surest way to ensure genuine parts for your device.

A panel problem

Hey guys! This is my second mail to you and I'm really in dire need of your expertise. I'm an avid reader of your great tech magazine. So my problem is I own a Lenovo Y50-70 laptop with 8GB of RAM and a NVIDIA GTX860M GPU. Now the problem is its display. It's a TN panel, its viewing angles are pretty much sore in the eyes. Colour production is damn poor. I don't know what to do with this screen. I'm really in a confused state about this display. Should I replace this one with an IPS panel or should I buy an external monitor for it? Also, if I go with the IPS panel one, will I get the same refresh rate? Please let me know whether I can get one. I mainly want to use that for gaming and movies. Help! :(

P.S. Y'all are doing great job. Love your magazine!

– Ankit

TN panels are great for gaming

A Hey Ankit, thank you for all the praise. It's readers like you for whom we love creating content. Coming to your problem, you should know that TN panels are great for gaming which is why the Y50-70 has one in the first place. You're right that these panels offer poor viewing angles, but the primary use-case of your laptop is dedicated towards gaming. We wouldn't recommend you to replace the panel on the laptop but if viewing angles are a huge concern and affect your experience significantly, then we would suggest you to go for an external monitor with an IPS display. You can go for the HP 22es IPS 21.5 inch display selling for around ₹9k, which has a resolution of 1920x1080 and a refresh rate of 60Hz.
