

Mars had a ring?

Apparently, Mars' moons are remnants of an existing ring; could form a new one in the future

The GX1200 serves as a good gaming cabinet for mid-range users. The absence of support for 140 mm fans might be a bummer for few enthusiasts but the cabinet does support up to 360 mm radiators on the front panel and 240 mm radiators on the top. Another limitation of the cabinet is low number of drive bays. You only have two trays for 3.5-inch HDDs and three trays for 2.5-inch SSDs.

Other than these shortcomings, the magic box is the only feature that stands out in the cabinet. It's great to have support for six fans since the motherboard usually leaves out one or two spare ports for cabinet fans. The fan hub also gives you control

₹8,000

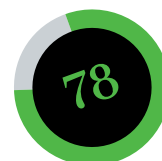

over the fan speeds but in order to toggle between the fan speeds, you'll need to open the side window panel every time. A dedicated button on the front IO panel would have been great, just like the light control button. The light control lets you cycle through the seven colours on the two fans and light strip on the bottom, giving you a gorgeously illuminated cabinet.

The GX1200 sells for around ₹7,400 on online stores. If you want more drive bays, you should spend more and get the Core V51 instead. It has immense potential for air and liquid cooling support. If budget is an issue then you can definitely go with the GX1200 in this price segment.

Canon PowerShot G7X II

Pint-sized performer

Compact cameras with 1-inch sensors have their own place in the imaging market, being fast, sharp shooters without the hassle of changing lenses, and being small enough to fit in pockets. The Canon PowerShot G7X II here produces bold, warm colour tones which retain good vibrancy and are accurate as well. Reds are clearly favoured, and greens are a bit subdued from what would have been optimum. The vibrancy somewhat makes up for the lack of emphasis and as a result, photos do not look bleak.

You can also shoot RAW for post production, making the G7X II versatile. Dynamic range is noticeably superior than its predecessor and noise performance is equally impres-

sive, particularly noticeable when you shoot under falling light conditions.

Compression of photos into JPEGs lead to a loss in colour vibrancy and richness. The photographs are slightly oversaturated by default, although white balance algorithms work accurately and seamlessly as per situations. However, when you shoot amidst a vibrant array of

colours and highly contrasting light areas, you do encounter the slightly limited dynamic range.

The PowerShot G7X II also offers good battery life. The viewfinder is more versatile, and touch response is really smooth. All of this makes the G7X

II a really impressive compact camera, particularly for its price.
