

Home for Indie games

Apple is finally adding a new permanent subsection for Independent game titles on the App Store. <http://digit.in/indieIOS>

Human-Free racing!

Robocars, as the name suggests is the company starting the world's first motorsports series for driverless cars. <http://digit.in/RoboraceU>

IEMs

pretty neat. If you like a fun or playful presentation this is what you should go for. If you are a bass fanatic the Brainwavs M2 is a better option. If you like the analytical or neutral type of sound the RHA S500i and MeeAudio M6 Pro is always there. For a broader soundstage the Brainwavz S3 is your best bet.

PROS

- + Bright sparkly sound
- + Minimalist, yet seems quite durable

CONS

- o Cable noise is a problem
- o No carry case

1MORE SINGLE DRIVER

1more is the OEM manufacturer that designed (and possibly manufactured) Xiaomi's Piston and Hybrid in-ears. They have only a few models in their collection but each headphone seems well thought out and purpose built. 1more even posts some impressive durability and testing standards on its website. The 1more 1M301 (a.k.a 1more Single Driver) has been tuned with by a Grammy Award Winning Sound Engineer, Luca Bignardi "to deliver a precise representation of your favorite music," says the company. Does it live up to the hype? Let's find out.

Build & Design: Before getting into what lies beneath, let's first start with what meets the eye. The 1more Single Driver is an exceptionally nice looking earphone. Yes I know aesthetics is a subjective area but I can't help marvelling at the design. The metal housing, the bright red fibre-sheathed cable, even the translucent silicon tips with their bright red core – all

of it gives the 1more a premium look. The headphones feature an aluminum alloy body while the cable consists of interior enameled copper wrapped around Kevlar fibre. The fibre is then coated with a TPE layer on which there's an braided nylon sheathing.

Performance & Features: The aural reproduction on the 1more can be best described as "clean". The 1more single driver is surprisingly detailed. On *Stereo Love* the subtle vocal echoes that are mixed to sweep from left to right are delightfully noticeable (timestamp 02:11). The way it rendered *Shine On (Live)* it was closer to the kind of upfront sound we saw on the RHA S500i – detailed but lacking a robust fullness to the sound. The 1more Single Driver does very well with vocals. Chris Rea's vocals on *Call On Me* sounded velvety smooth and rich. It started faltering with instrument heavy metal tracks like *Pull Me Under* by *Dream Theater*. A bit of the upper mid range started getting subdued. But we are just nitpicking, overall the 1more sounds quite nice.

Verdict: The 1more Single Driver is quite attractively priced squarely in middle of the price range we've selected for this test. At ₹2,700, they offer great clarity across the spectrum. If you listen to a lot of rock or metal you'd do better upping your budget slightly and picking up something like the M6 Pro. But if you are into genres which need an emphasis on vocals you won't go wrong with the 1more.

PROS

- + Clean, balanced sound
- + Looks great
- + High quality materials

CONS

- o A little more detail in the highs would've been nice

TEKFUSION TWINWOOFERS M2

Most of you will remember Tekfusion the Bangalore-based Indian audio manufacturer for its 2013 release original Twinwoofers. It was quite a successful in-ear, almost always being featured on any affordable IEM roundup (much like the one-time budget king EP630). The original Twinwoofers were known for their bass-focus and affordable pricing. With the release of the updated version, Tekfusion has upped the price a bit and is now competing in the "slightly above entry-level" segment.

Build & Design: The Twinwoofer M2's chassis is crafted out of aluminum. The headphone housing looks fairly

at the same time manages to coil up easily for easy stowing. The hardcase that it comes with is fairly roomy and serves its function well.

Features & Performance: The Twinwoofers M2 go head to head with the other similarly priced in-ear headphone in this test - the SoundMagic E10C. The two similarly priced in-ears were also similar in their aural prowess. What's a test without the challenge of unearthing nuance right? Straight off the bat you can tell that the Twinwoofers M2 has good bass. Well, good in the sense of quantity at least, if not accuracy. EDM sounds distinctly better on these than the E10C. Unlike the tuning of the first Twinwoofers which quite frankly overdid the bass, these seem more balanced in their tuning (far from neutral though). Where it falls ever so slightly behind the E10C in delivering finer detail, it makes up for by giving a more well rounded mid-range. The tiebreaker of sorts was delivered by our new entrant to the test tracks – *Ed Sheeran's Shape Of You* (man that song's catchy!). The point where the pipe drum kicks in (timestamp 1:50) is when Twinwoofers M2 inches ever so slightly ahead.

Verdict: For the ₹2000 price point the Tekfusion Twinwoofers M2 offer great value. You get a solid performing in-ear headphone that looks nice, sounds decent and feels durable.

PROS

- + Great value
- + Decent sound

CONS

- o Detail could've been better (cuz we always want more)

Tekfusion Twinwoofers M2

nice with their matte black finish and silver accents. The cable has a braided core with an outer protective polymer sheathing. There is an in-line single button remote with mic. The cable remains remarkably tangle free and
