

WEB OF WAR

The internet would likely not have been born without the military's need to wage war, or at least it would not have been born at ARPA. How the hair-trigger nuclear age and fears of Armageddon inspired visionary warriors during the Cold War to invent the internet. <http://dgit.in/ARPANET1>

ABUSING BANANA FARMING

A single banana seems whimsical—yellow and sweet, contained in its own easy-to-open peel. It is a charming breakfast luxury as silly as it is delicious and ever-present. However, having the food we want when we want it threatens our food supply and our future. <http://dgit.in/bananaH>

THE MISSING LINK WITH AI

Machine learning has produced many tremendous practical applications in recent years but we are still nowhere near achieving human-like AI. The current layered model of cognition is wrong, and most AI researchers are missing a central piece of the puzzle: embodiment. <http://dgit.in/Albody>

MODERN ASTRONOMY WITH COMPUTERS

It makes sense, then, that computers would be such useful tools in modern astronomy. Machine Learning is bringing the cosmos into focus. Training neural networks to identify galaxies could forever change humanity's perspective of the universe. <http://dgit.in/spaceAstro>

Can Tesla deliver 300MWh power in 100 days?

Musk's confidence behind promising large amounts of power to Australia lies in Tesla's new Gigafactory in Nevada.

— By Souvik Das

Most of Elon Musk's ventures are working for the future of technology, but his brainchild Tesla is also doing stable work to promote cleaner energy sources in present times. Now, it claims that the same can be done in commendable pace. Recently, Tesla's Vice President for Energy Products, Lyndon Rive, introduced the Powerwall 2, Tesla's new home battery setup. In process of the announcement, Rive claimed that the company's battery technology, aided by

its snazzy new facility, can deliver up to 300 Megawatt hour of power in a mere 100 days to halt increasing power cuts in Southern Australia.

Among many who took to the claims was Atlassian co-founder, Mike Cannon-Brookes, who posted a direct query on Twitter, on exactly how serious is Tesla. Musk then followed up by reinstating Tesla's power delivery claims, and also stated that the company will do it "100 days from contract signature or it is free." This conversation led to Brookes stating

"you're on", who also went ahead and asked for a quote. The conversation went as follows:

Musk's quote puts battery pack-level price at approximately \$75 million for 300MWh of power, which is about the total power shortage that is leading to frequent power cuts and a potential blackout in the near future. Australian senator Sarah Hanson-Young also joined in on the conversation, expressing interest in hosting a conversation with Musk and Tesla regarding the same.

While most of these things are for the business heads to figure out, we focus on Tesla, its new Gigafactory and the latest home battery pack, the Powerwall 2. Tesla is one of the biggest battery companies, providing for its own lineup of all-electric cars alongside the less glamorous, more professional commercial power supply division. The com-
