now is to address customer issues (like implementing customer care systems) using AI, more advanced use-cases are beginning to surface. It is evident that India is a considerably complex market to implement AI due to the diversity of languages involved.

“There will be huge growth in job demand in machine learning and data science”, says Dr. Debashis Guha, Program Director, Machine Learning, SP Jain School of High Technology, “The global machine learning market is expected to reach \$12.5 billion in 2019, up from \$2.5 billion in 2014, at a CAGR (Compounded Annual Growth Rate) of 38%. The job market should see at least a 30% CAGR. Job openings range from positions requiring only about a year of experience in R or Python, to seasoned professionals with more than 10 years of experience. Serving as Product Managers, they should be capable enough to define the project requirements and the solution architecture. This also suggests a career arc, starting from positions involved with the nitty gritty of coding and implementation. This evolves to people entering senior positions who are the ones defining requirements,

planning the architecture, and carrying out the projects.”

When it comes to compensation, the low demand-supply ratio in this area ensures that they are quite competitive. For example, according to Glassdoor, a machine learning scientist at Amazon in India could make about 33 to 36 lakhs per annum. Looking at more popular estimates, it would be safe to say that one could easily expect a starting compensation of more than six lakhs for an entry level Data Scientist role which could effectively go up to 15-17 lpa depending on the employer.

Although, if you were to look for a job abroad, you would be looking at more matured and demanding markets. For instance, according to Ishan Gupta, the average salary of an Artificial Intelligence Engineer in Silicon Valley is around \$158,123 per year.

Bye-bye humans?

Not necessarily, as this article must have told you by now. Just like any other technological revolution, the advent of AI in the workplace has created a panic-driven situation where people are

worried which jobs will be stolen by robots next. Now that you’ve understood what AI signifies as a profession, it must be clear that the demand for eligible people in the field of AI is only increasing the number of jobs in the market. Down the line, the people replaced by AI implementations will be absorbed again in new expertise areas which are being created everyday due to the advent of AI.

On the other hand, the industry is benefitting greatly from AI technologies. Downtimes are reducing, scope of human error is decreasing with corresponding increase in efficiency. “Companies are increasingly taking on the data-driven approach and there is a vast demand for professionals who can use artificial intelligence and convert it into meaningful business outcomes,” says Ishan Gupta. “There has been a rising adoption of machine learning and artificial intelligence technologies in multiple industries such as healthcare, finance, education, retail, media, advertising and education. Global developments in the field of artificial intelligence are going to define the future. Graduates of AI programs will be uniquely poised to contribute to these developments in innovative and awe-inspiring ways.” With interest in this field rising everyday, now would be the time to get started on the skills mentioned earlier, so that someday you can be remembered in history as the person who brought about the rise of the robots and the end of humanity. 

AI SKILLS MASTER LIST

A list of skills and areas to focus on to build an expertise in AI

- Mathematics: Probability, Statistics, Algebra, Calculus
- Core machine learning: supervised, unsupervised and reinforcement learning
- Advanced machine learning: Neural and especially deep networks, SVM and kernel tricks, ensemble methods, Markov decision processes
- Algorithms: Mathematical optimisation, dynamic programming, data structures and data processing algorithms
- Software: Python, Java, R, also SAS, SPSS
- Distributed computing: cloud computing, parallel computing, Hadoop, Spark
- OS: Unix, especially Ubuntu
- Other: Signal, image and speech processing techniques
