Me too

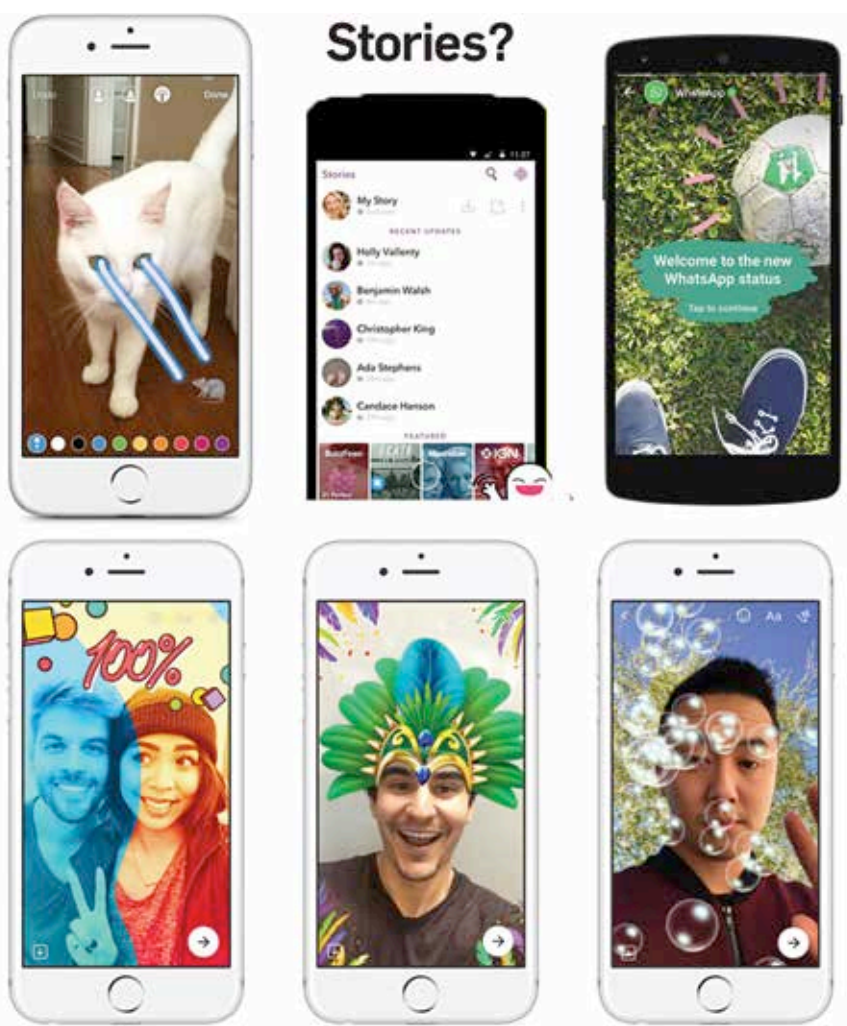

Tech that's just too similar to tell apart

There was a time when being distinct was essential in the tech industry. Yes, people were still building phones, apps and other things that the tech industry generally does, but innovation was a key characteristic of being a technology giant. Without meaning to imply that there is absolutely no innovation, one look at the smartphone industry will show you how everything looks and feels just the same. Needless to say, this tendency to replicate what is successful is destroying innovation, not only in the device manufacturing industry, but the tech industry in general.

And even where it's not doing that, it is hilarious and irritating at the same time to see the same feature, same design, same action on every platform and device that you interact with. With that being said, let's have a look at some of the most obvious and bothersome "me-too"s in tech.

Storytime

This could possibly be what prompted this article to begin with. Snapchat began in 2011 and the disappearing picture and video format was quite popular, especially because no one else was doing it. Pretty soon, Snapchat was offering additional features on the app. One such feature was Stories, which let you present your disappearing snaps in chronological order to your friends and followers on the platform. Within a year of its introduction, i.e by summer 2014, the number of pictures and videos being shared via Stories had surpassed the earlier person-to-person private snaps.

Honestly, can you tell them apart with one look?

Although it took them a couple of years and an acquisition by Facebook, Instagram also launched their own version of stories called Instagram Stories. Sounds like they weren't even trying to be original, right? That's because they weren't. "They deserve all the credit", said Instagram CEO Kevin Systrom

to Techcrunch in an interview, when asked about the implied copying.

One look at Instagram stories now, and you can tell where they are headed - geotagging, drawing tools, stickers and more are already there, and you can check out an infographic at <http://digit.in/IvsSInfoG> to understand that
